REVISION HISTORY

Revision	Release Date	Summary
1.0	2016/07/15	First release.
1.1	2016/07/25	Added RTL8762AJ data.

Table of Contents

1. GENERAL DESCRIPTION	1
1.1. OVERVIEW	1
1.2. RTL8762A MEMORY ARCHITECTURE	2
2. FEATURES	3
3. APPLICATIONS.....	4
4. BLOCK DIAGRAMS	5
5. PIN ASSIGNMENTS.....	6
5.1. RTL8762AR PIN ASSIGNMENTS	6
5.2. PACKAGE IDENTIFICATION	6
5.3. RTL8762AG PIN ASSIGNMENTS.....	7
5.4. PACKAGE IDENTIFICATION	7
5.5. RTL8762AJ PIN ASSIGNMENTS	8
5.6. PACKAGE IDENTIFICATION	8
5.7. RTL8762AK PIN ASSIGNMENTS.....	9
5.8. PACKAGE IDENTIFICATION	9
6. PIN DESCRIPTIONS.....	10
6.1. RF INTERFACE	10
6.2. XTAL AND SYSTEM INTERFACE	10
6.3. GENERAL PURPOSE IOS	10
6.4. POWER PINS	14
7. PERIPHERAL INTERFACE DESCRIPTIONS	15
7.1. PIN MULTIPLEXER.....	15
7.2. REAL-TIME COUNTER (RTC).....	22
7.3. PWM	26
7.4. GPIO CONTROL	29
7.5. HARDWARE TIMER (TIM).....	31
7.6. QUADRATURE DECODER	34
7.7. SPI 2-WIRE.....	39
7.8. HARDWARE KEYS CAN	42
7.9. AUXADC.....	46
7.10. DATA UART	55
7.11. IR RC	64
7.12. SPI0/SPI1	69
7.13. I2C.....	76
7.14. UART	91

1. General Description

1.1. Overview

The RTL8762AG/RTL8762AR/RTL8762AJ/RTL8762AK (hereafter referred to as the RTL8762A) are ultra-low power system on-chip solutions for Bluetooth low energy applications that combines the excellent performance of a leading RF transceiver with a low-power ARM[®] Cortex[™]-M0, 256KB eFlash, 80KB RAM, and rich powerful supporting features and peripherals.

The embedded ARM[®] Cortex[™]-M0 32-bit CPU features a 16-bit instruction set with 32-bit extensions (Thumb-2[®] technology) that delivers high-density code with a small memory footprint. By using a single-cycle 32-bit multiplier, a 3-stage pipeline, and a Nested Vector Interrupt Controller (NVIC), the ARM[®] Cortex[™]-M0 CPU makes program execution simple and highly efficient.

In the RTL8762A, we support the Serial Wire Debug (SWD) interface provided as part of the Debug Access Port (DAP), in conjunction with the Basic Branch Buffer (BBB). This offers a flexible and powerful mechanism for non-intrusive program code debugging. Users can easily add breakpoints in the code and perform single-step debugging.

The RTL8762A memory architecture (see Figure 1, page 2) includes 80KB of data RAM that can be divided into three portions, e.g., 16KB for buffer RAM, 24KB for on-RAM, and 40KB for off-RAM. Specifically, the available memory for APPs includes 9KB in on-RAM and 18KB in off-RAM. Each on-RAM and off-RAM can be divided into static and dynamic areas. The area size can be adjusted via eFUSE.

The on-RAM can maintain data when the system is in Deep Low Power State (DLPS) mode (Data in off-RAM is lost when the system enters DLPS mode). The static area refers to the global variables in the program. The dynamic area refers to the direct or indirect call of the OS's pvPortMalloc allocated space, such as xQueueCreate, xTaskCreate, etc.

The RTL8762A also integrates a sigma-delta ADC, programmable gain amplifier, and microphone bias circuit for voice command application. The RTL8762A embeds IR transceiver, hardware keyscan, and Quad-decoder on a single IC, and is provided in a QFN package.

Package and pin differences between the AG/AR/AJ/AK versions are described in this document where they arise.

1.2. RTL8762A Memory Architecture

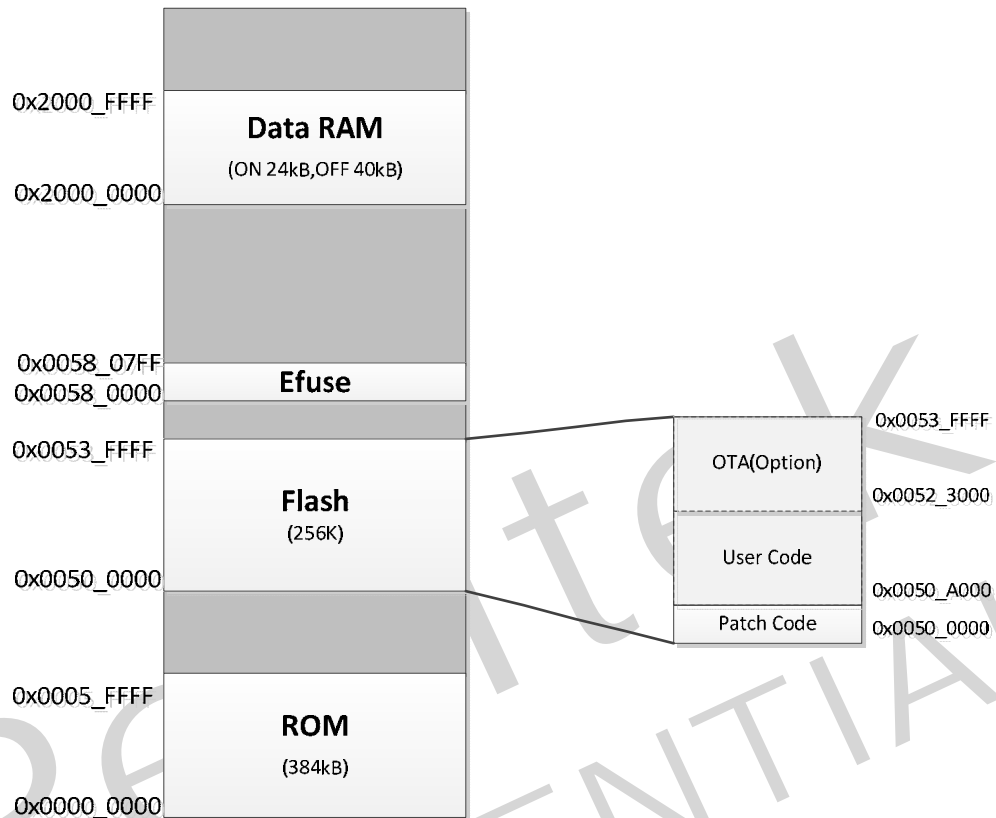

Figure 1. RTL8762A Memory Architecture

2. Features

General

- Ultra low power consumption with intelligent PMU
- Supports Bluetooth 4.2 core specification
- Integrated MCU to execute Bluetooth protocol stack
- Supports multiple level Low Energy states
- Supports LE L2CAP Connection Oriented Channel Support
- Supports LE low duty directed advertising
- Supports LE data length extension feature
- Supports OTA (Over-the-Air) programming mechanism for firmware upgrade
- Supports external 32KHz XTAL for low power mode
- Supports GAP, ATT/GATT, SMP, L2CAP
- Generic Applications for GAP Central, Peripheral, Observer and Broadcaster Roles

Platform

- ARM Cortex-M0 (Maximum 53MHz)
- 256KB embedded flash
- 80KB RAM
- 2KB eFUSE
- Supports AES128/192/256 encrypt/decrypt engine

Bluetooth Transceiver

- Fast AGC control to improve receiving dynamic range
- Supports Bluetooth Low Energy PHY

Peripheral Interfaces

- Flexible General Purpose IOs
 - ◆ RTL8762AR: 15 GPIOs
 - ◆ RTL8762AG: 16 GPIOs
 - ◆ RTL8762AJ: 23 GPIOs
 - ◆ RTL8762AK: 37 GPIOs
- Three configurable LED pins
- Hardware Keyscan and Quad-decoder
- Embedded IR transceiver
- Real-Time Counters (RTC)
- Supports generic 4-wire SPI master/slave
- Supports Low power comparator
- Timers x 8
- I2C x 2
- PWM x 4
- UART x 3
- Supports 40MHz XTAL
- Supports audio ADC for voice command application

Package

- RTL8762AR: 32-pin 5mm² QFN
- RTL8762AG: 32-pin 5mm² QFN
- RTL8762AJ: 40-pin 5mm² QFN
- RTL8762AK: 56-pin 7mm² QFN

3. Applications

- TV Remote Controller
- LE HID
- Beacon
- Home Automation
- Key Fob
- Wristband
- Wearable Device

Realtek
CONFIDENTIAL
for UTE

4. Block Diagrams

5. Pin Assignments

5.1. RTL8762AR Pin Assignments

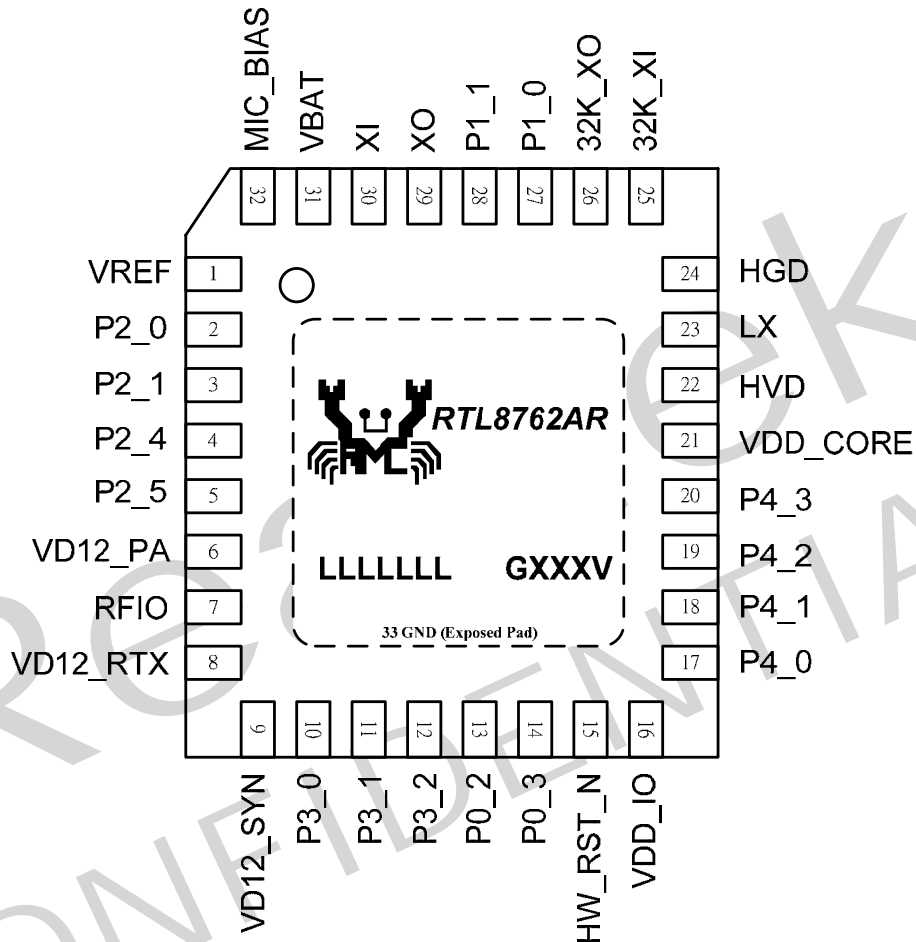

Figure 4. RTL8762AR Pin Assignments

5.2. Package Identification

Green package is indicated by the 'G' in GXXXXV (Figure 4).

5.3. RTL8762AG Pin Assignments

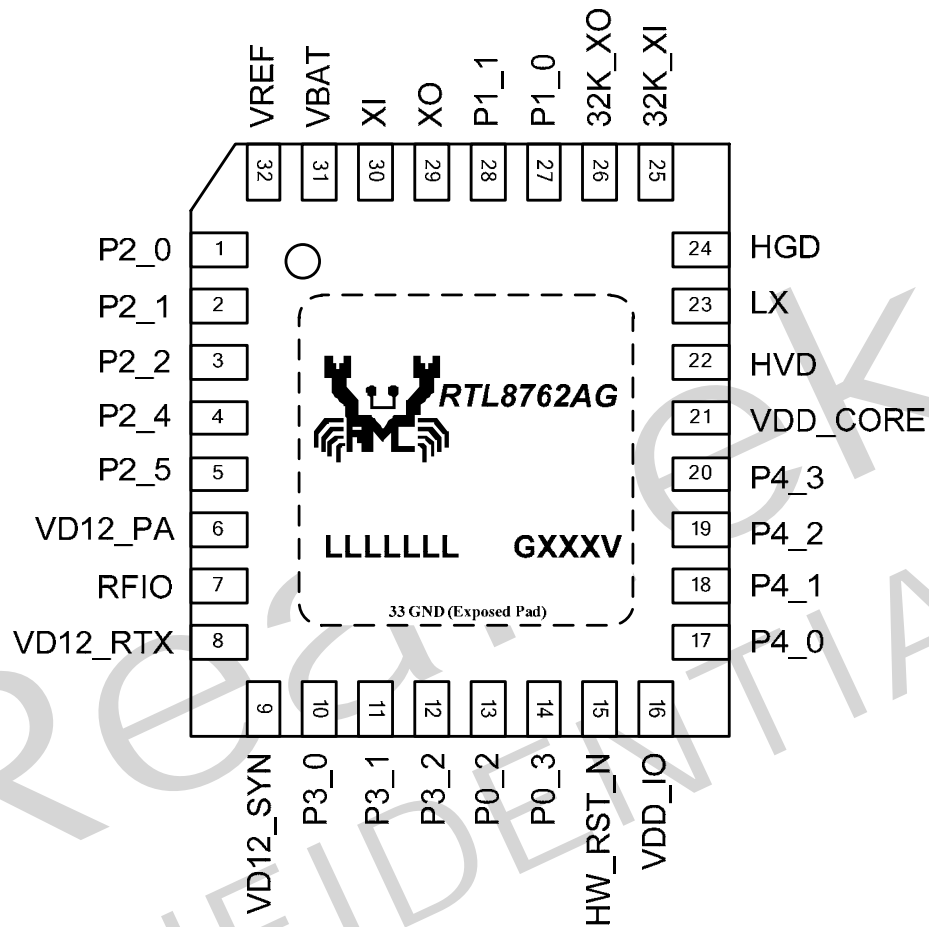

Figure 5. RTL8762AG Pin Assignments

5.4. Package Identification

Green package is indicated by the 'G' in GXXXV (Figure 5).

5.5. RTL8762AJ Pin Assignments

Figure 6. RTL8762AJ Pin Assignments

5.6. Package Identification

Green package is indicated by the 'G' in GXXXV (Figure 6).

5.7. RTL8762AK Pin Assignments

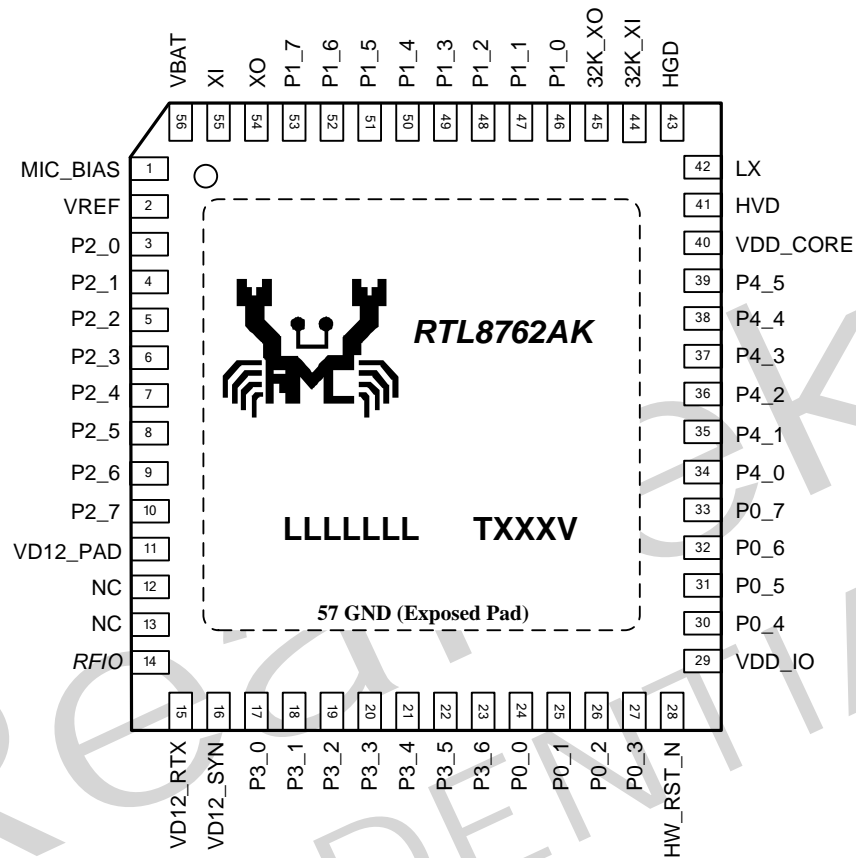

Figure 7. RTL8762AK Pin Assignments

5.8. Package Identification

Green package is indicated by the 'G' in GXXXV (Figure 7).

6. Pin Descriptions

The following signal type codes are used in the tables:

I: Input

O: Output

P: Power

6.1. RF Interface

Table 1. RF Interface

Symbol	Type	Pin No				Description
-	-	AR	AG	AJ	AK	-
RFIO	I	7	14	9	14	BT RX signal/BT TX signal (low power mode)

6.2. XTAL and System Interface

Table 2. XTAL and System Interface

Symbol	Type	Pin No				Description
-	-	AR	AG	AJ	AK	-
32K_XI	I	25	25	31	44	32k crystal input or external 32k clock input
32K_XO	O	26	26	32	45	32k crystal output
XI	I	30	30	38	55	40MHz crystal input or external 40MHz clock input
XO	O	29	29	37	54	40MHz crystal output
HW_RST_N	I	15	15	19	28	Hardware reset pin; low active

6.3. General Purpose I/Os

Table 3. General Purpose I/Os

Symbol	Type	Pin No				Description
-	-	AR	AG	AJ	AK	-
P0_0	IO	-	-	15	24	General purpose IO (GPIO); refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down.
P0_1	IO	-	-	16	25	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down.

Symbol	Type	Pin No				Description
-	-	AR	AG	AJ	AK	-
P0_2	IO	13	13	17	26	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 20mA driving capability. With wakeup function. With internal pull-up and pull-down.
P0_3	IO	14	14	18	27	LOG_UART TX. Erase eFlash trigger. Power on trap; pull-up to erase eFlash content when powered on. (default PAD internal pull-down). <i>Note: We recommend this pin is connected via a resistor to ground.</i>
P0_4	IO	-	-	-	30	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 20mA driving capability. With internal pull-up and pull-down.
P0_5	IO	-	-	-	31	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 20mA driving capability. With internal pull-up and pull-down.
P0_6	IO	-	-	-	32	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P0_7	IO	-	-	-	33	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P1_0	IO	27	27	33	46	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down. SWDIO (default).
P1_1	IO	28	28	34	47	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down. SWDCLK (default).
P1_2	IO	-	-	35	48	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P1_3	IO	-	-	36	49	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P1_4	IO	-	-	-	50	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P1_5	IO	-	-	-	51	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P1_6	IO	-	-	-	52	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.

Symbol	Type	Pin No				Description
-	-	AR	AG	AJ	AK	-
P1_7	IO	-	-	-	53	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P2_0	IO	2	1	2	3	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down. AUXADC input 0.
P2_1	IO	3	2	3	4	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down. AUXADC input 1.
P2_2	IO	-	3	-	5	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down. AUXADC input 2.
P2_3	IO	-	-	-	6	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down. AUXADC input 3.
P2_4	IO	4	4	4	7	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down. AUXADC input 4.
P2_5	IO	5	5	5	8	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down. AUXADC input 5.
P2_6	IO	-	-	6	9	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down. AUXADC input 6.
P2_7	IO	-	-	7	10	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down. AUXADC input 7.
P3_0	IO	10	10	12	17	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down. HCI_UART_TX (default).

Symbol	Type	Pin No				Description
-	-	AR	AG	AJ	AK	-
P3_1	IO	11	11	13	18	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down. HCI_UART_RX (default).
P3_2	IO	12	12	14	19	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. With wakeup function. With internal pull-up and pull-down. 8mA driving capability.
P3_3	IO	-	-	-	20	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P3_4	IO	-	-	-	21	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P3_5	IO	-	-	-	22	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P3_6	IO	-	-	-	23	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.
P4_0	IO	17	17	23	34	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down.
P4_1	IO	18	18	24	35	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down.
P4_2	IO	19	19	25	36	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down.
P4_3	IO	20	20	26	37	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With wakeup function. With internal pull-up and pull-down. Low power comparator input.
P4_4	IO	-	-	-	38	General purpose IO; refer to Table 6, Pin Multiplexer, page 15. 8mA driving capability. With internal pull-up and pull-down.

6.4. Power Pins

Table 4. Power Pins

Symbol	Type	Pin No				Description
-	-	AR	AG	AJ	AK	-
VREF	P	1	32	1	2	ADC reference voltage (decouple)
VD12_PA	P	6	6	8	11	Supply 1.2V power for PA
VD12_RTX	P	8	8	10	15	Supply 1.2V power for RF transceiver
VD12_SYN	P	9	9	11	16	Supply 1.2V power for synthesizer
VDD_IO	P	16	16	20	29	Supply 1.8V~3.3V power for digital IO PADs
VDD_CORE	P	21	21	27	40	Supply 1.2V power for digital core
HVD	P	22	22	28	41	Supply 1.8V~3.3V power for Switching regulator input
LX	P	23	23	29	42	Switching regulator output
HGD	P	24	24	30	43	Ground for switching regulator
VBAT	P	31	31	39	56	Battery voltage input
MIC_BIAS	P	32	-	40	1	Microphone bias

7. Peripheral Interface Descriptions

The RTL8762A series peripheral descriptions are shown in the table below.

Table 5. Peripheral Interface Descriptions

Physical Address	IP Function
0x4000_0000 - 0x4000_0FFF	SYS Control
0x4000_0100 - 0x4000_012F	RTC
0x4000_0364 - 0x4000_0387	PWM
0x4000_1000 - 0x4000_17FF	GPIO
0x4000_2000 - 0x4000_2FFF	Timer
0x4000_3000 - 0x4000_33FF	Internal use
0x4000_4000 - 0x4000_402B	Quad Decoder
0x4000_4030 - 0x4000_4053	2-wire SPI
0x4000_6000 - 0x4000_6FFF	Key Scan
0x4000_8000 - 0x4000_8FFF	Internal use
0x4001_0000 - 0x4001_0FFF	ADC
0x4004_0000 - 0x4004_03FF	Data UART
0x4004_1000 - 0x4004_1FFF	IR RC
0x4004_2000 - 0x4004_23FF	SPI_0
0x4004_2400 - 0x4004_27FF	SPI_1
0x4004_4000 - 0x4004_43FF	I2C_0
0x4004_4400 - 0x4004_47FF	I2C_1
0x4006_0000 - 0x4006_07FF	GDMA

7.1. Pin Multiplexer

All GPIO pins in the RTL8762A are configurable via the built-in pin multiplexer. Table 6 shows all GPIO pin configurations. Figure 8, page 16 shows the PINMUX and GPIO PADs control path. In the RTL8762A, all pins have an internal pull-up and pull-down resistor for controlling GPIO_PU and GPIO_PD.

Table 6. Pin Multiplexer

[Decimal Number]: [Pin Function]			
0: Idle mode	25: qdec_phase_a_z	50: SPI2W_DATA (master only)	75: KEY_ROW_0
1: HCI_UART_TX	26: qdec_phase_b_z	51: SPI2W_CLK (master only)	76: KEY_ROW_1
2: HCI_UART_RX	27: LOG_UART_TX	52: SPI2W_CS (master only)	77: KEY_ROW_2
3: HCI_UART_CTS	28: LOG_UART_RX	53: SWD_CLK	78: KEY_ROW_3
4: HCI_UART_RTS	29: IRDA_TX	54: SWD_DIO	79: KEY_ROW_4
5: I2C0_CLK	30: IRDA_RX	55: KEY_COL_0	80: KEY_ROW_5
6: I2C0_DAT	31: RTC_CLK_OUT	56: KEY_COL_1	81: KEY_ROW_6
7: Not used	32: DATA_UART_TX	57: KEY_COL_2	82: KEY_ROW_7

[Decimal Number]: [Pin Function]			
8: Not used	33: DATA_UART_RX	58: KEY_COL_3	83: DMIC_DATA

7.2. Real-Time Counter (RTC)

There are 24-bit counters with four individual comparators. The counter is clocked by an internal 32KHz clock with 12-bit pre-scalar. The comparators output can interrupt the CPU and wake up the chip from DLPS mode. The RTC block diagram is shown below.

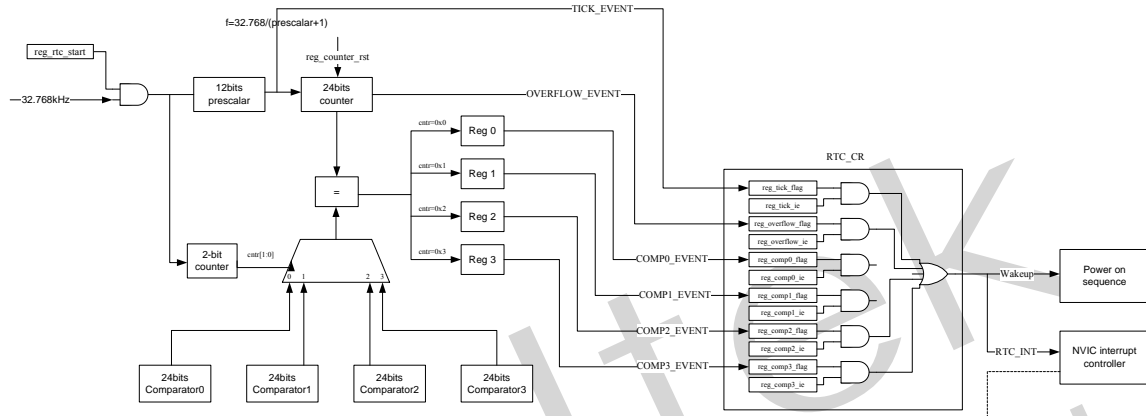

Figure 9. RTC Block Diagram

Table 8. RTC (Base Address: 0x4000_0000)

Offset	Bit	Access	INI	Symbol	Description
0x100 RTC Controller Register0 (RTC_CR0)					
0x100	[31]	R/W	0x0	reg_rtc_clk_sel	RTC clock source sel 0x0: From BTAON (xtal or ring osc) 0x1: From 32k sdm
	[30]	R/W	0x0	reg_rtc_tick_flag_on	Enable or disable RTC tick function 0x1: Enable 0x0: Disable
	[29:20]	-	-	-	Reserved
	[19]	R/W	0x0	reg_comp3_on	Enable or disable compare3 function 0x1: Enable 0x0: Disable
	[18]	R/W	0x0	reg_comp2_on	Enable or disable compare2 function 0x1: Enable 0x0: Disable
	[17]	R/W	0x0	reg_comp1_on	Enable or disable compare1 function 0x1: Enable 0x0: Disable
	[16]	R/W	0x0	reg_comp0_on	Enable or disable compare0 function 0x1: Enable 0x0: Disable
	[15:8]	-	-	-	Reserved
	[7]	R/W	0x0	reg_counter_overflow_clk_en	Switch RTC counter clock to 32KHz 0x1: Enable 0x0: Disable

0x12C RTC Status Register (Off Domain)					
0x12C	[31]	R/W	0x1	reg_rtc_int_ctrl_en	RTC interrupt control enable signal 0x1: Enable off-domain RTC interrupt control 0x0: Disable
	[30:20]	-	-	-	Reserved
	[19]	R/W	0x0	reg_comp3_flag	Event Status of Comparator3 This flag is set by hardware when a comparator3 match event occurs while reg_comp3_ie is already set. This flag is cleared by software by writing 1.
	[18]	R/W	0x0	reg_comp2_flag	Event Status of Comparator2 This flag is set by hardware when a comparator2 match event occurs while reg_comp2_ie is already set. This flag is cleared by software by writing 1.
	[17]	R/W	0x0	reg_comp1_flag	Event Status of Comparator1 This flag is set by hardware when a comparator1 match event occurs while reg_comp1_ie is already set. This flag is cleared by software by writing 1.
	[16]	R/W	0x0	reg_comp0_flag	Event Status of Comparator0 This flag is set by hardware when a comparator0 match event occurs while reg_comp0_ie is already set. This flag is cleared by software by writing 1.

Offset	Bit	Access	INI	Symbol	Description
	[15:5]	-	-	-	Reserved
	[4]	R/W	0x0	reg_lpcomp_flag	Event Status of LPCOMP This flag is set by hardware when a LPCOMP comparator match event occurs while reg_lpcomp_ie is already set. This flag is cleared by software by writing 1.
	[3:2]	-	-	-	Reserved
	[1]	R/W	0x0	reg_overflow_flag	Event Status of Overflow This flag is set by hardware when a counter overflow event occurs while reg_overflow_ie is already set. This flag is cleared by software by writing 1.
	[0]	R/W	0x0	reg_tick_flag	Event Status of Tick This flag is set by hardware when a counter overflow event occurs while reg_tick_ie is already set. This flag is cleared by software by writing 1.

7.3. PWM

The RTL8762A supports four channel PWM outputs that are individually clocked by a hardware timer. The clock source of the hardware timer is selected from a 32KHz or 10MHz clock as shown below.

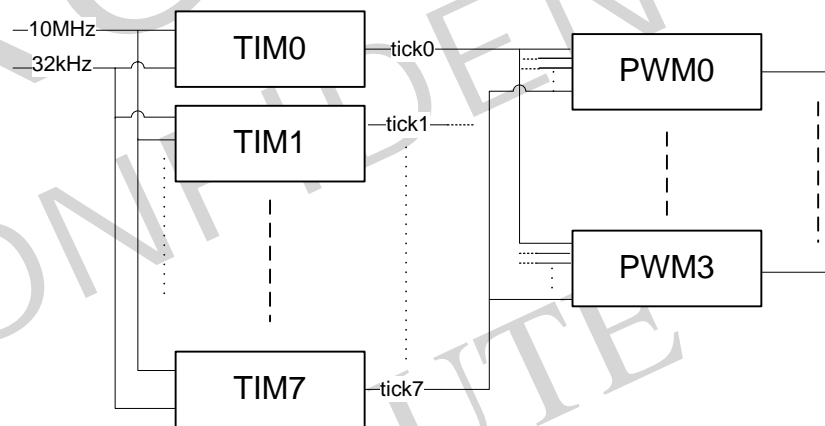

Figure 10. PWM is Clocked by Hardware Timer

Table 9. PWM (Base Address: 0x4000_0000)

	[11:8]	R/W	0	BIT_PERI_GT_EVT1_PULSE_DUR	The event timer output pulse duration 0: 32μs 1: 64μs 2: 128μs 3: 256μs
	[7]	R/W	0	BIT_PERI_GT_EVT0_EN	Enable timer event
	[6:4]	R/W	0	BIT_PERI_GT_EVT0_SRC_SEL	0: Timer event from timer 0 7: Timer event from timer 7

Offset	Bit	Access	INI	Symbol	Description
	[3:0]	R/W	0	BIT_PERI_GT_EVT0_PULSE_DUR	The event timer output pulse duration 0: 32μs 1: 64μs 2: 128μs 3: 256μs

7.4. GPIO Control

Table 10. GPIO Control (Base Address: 0x4000_1000)

Offset	Bit	Access	INI	Symbol	Description
gpio_swporta_dr: Port A Data Register					
0x00	[31:0]	R/W	0x0	gpio_swporta_dr	Values written to this register are output on the I/O signals for Port A if the corresponding data direction bits for Port A are set to Output mode and the corresponding control bit for Port A is set to Software mode.
gpio_swporta_ddr: Port A Data Direction Register					
0x04	[31:0]	R/W	0x0	Port A Data Direction Register	Values written to this register independently control the direction of the corresponding data bit in Port A. The default direction can be configured as input or output after system reset through the GPIO_DFLT_DIR_A parameter. 0: Input (default) 1: Output
gpio_swporta_ctl: Port A Data Source					
0x08	[31:0]	R/W	0x0	Port A Data Source	The data and control source for a signal can come from either software or hardware; this bit selects between them. 0: Software mode (default) 1: Hardware mode
gpio_inten: Interrupt Enable					
0x30	[31:0]	R/W	0x0	Interrupt enable	Allows each bit of Port A to be configured for interrupts. By default the generation of interrupts is disabled. Whenever a 1 is written to a bit of this register, it configures the corresponding bit on Port A to become an interrupt; otherwise, Port A operates as a normal GPIO signal. Interrupts are disabled on the corresponding bits of Port A if the corresponding data direction register is set to Output or if Port A mode is set to Hardware. 0: Configure Port A bit as normal GPIO signal (default) 1: Configure Port A bit as interrupt

Offset	Bit	Access	INI	Symbol	Description
gpio_intmask: Interrupt Mask					
0x34	[31:0]	R/W	0x0	Interrupt mask	Controls whether an interrupt on Port A can create an interrupt for the interrupt controller by not masking it. By default, all interrupts bits are unmasked. Whenever a 1 is written to a bit in this register, it masks the interrupt generation capability for this signal; otherwise interrupts are allowed through. The unmasked status can be read as well as the resultant status after masking. 0: Interrupt bits are unmasked (default) 1: Mask interrupt
gpio_inttype_level: Interrupt Level					
0x38	[31:0]	R/W	0x0	Interrupt level	Controls the type of interrupt that can occur on Port A. Whenever a 0 is written to a bit of this register, it configures the interrupt type to be level-sensitive; otherwise, it is edge-sensitive. 0: Level-sensitive (default) 1: Edge-sensitive
gpio_int_polarity: Interrupt Polarity					
0x3C	[31:0]	R/W	0x0	Interrupt polarity	Controls the polarity of edge or level sensitivity that can occur on input of Port A. Whenever a 0 is written to a bit of this register, it configures the interrupt type to falling-edge or active-low sensitive; otherwise, it is rising-edge or active-high sensitive. 0: Active-low (default) 1: Active-high
gpio_intstatus: Interrupt Status					
0x40	[31:0]	R	0x0	Interrupt status	Interrupt status of Port A
gpio_porta_eoi: Clear Interrupt					
0x4C	[31:0]	R/W	0x0	Clear interrupt	Controls the clearing of edge type interrupts from Port A. When a 1 is written into a corresponding bit of this register, the interrupt is cleared. All interrupts are cleared when Port A is not configured for interrupts. 0: No interrupt clear (default) 1: Clear interrupt
gpio_ext_porta: External Port A					
0x50	[31:0]	R	0x0	External Port A	When Port A is configured as Input, then reading this location reads the values on the signal. When the data direction of Port A is set as Output, reading this location reads the data register for Port A.

Table 11. GPIO Control (Base Address: 0x4000_8000)

Offset	Bit	Access	INI	Symbol	Description
REG_LOW_PRI_INT_STATUS					
0x04	[31:17]	R/W	0	-	Reserved
	[16]	R/W	0	gpio_intr[31:6]	DW GPIO interrupt status [31:6] (OR'ed)
	[15:10]	R/W	0	-	Reserved
	[9]	R/W	0	timer_intr[7]	DW Timer interrupt status [7]
	[8]	R/W	0	timer_intr[6]	DW Timer interrupt status [6]
	[7]	R/W	0	timer_intr[5]	DW Timer interrupt status [5]
	[6]	R/W	0	timer_intr[4]	DW Timer interrupt status [4]
	[5]	R/W	0	timer_intr[3]	DW Timer interrupt status [3]
	[4]	R/W	0	gpio_intr[5]	DW GPIO interrupt status [5]
	[3]	R/W	0	gpio_intr[4]	DW GPIO interrupt status [4]
	[2]	R/W	0	gpio_intr[3]	DW GPIO interrupt status [3]
	[1]	R/W	0	gpio_intr[2]	DW GPIO interrupt status [2]
	[0]	R/W	0	spi_intr	SPI flash controller interrupt status
REG_LOW_PRI_INT_MODE					
0x08	[31:0]	R/W	0	BIT_LOW_PRI_INT_MODE	Each bit control corresponding interrupt mode. 1: Rising edge trigger 0: High level active
REG_LOW_PRI_INT_EN					
0x0c	[31:0]	R/W	0	BIT_LOW_PRI_INT_MODE	Each bit control corresponding interrupt mode. 1: Rising edge trigger 0: High level active

7.5. Hardware Timer (TIM)

There are eight programmable 32-bit timers with free-running and user-defined count modes. The Timer clock source selection is shown below.

Table 12. Hardware Timer (Base Address: 0x4000_0000)

Offset	Bit	Access	INI	Symbol	Description
REG_PERI_GTIMER_CLK_SRC					
0x360	[31:14]	R/W	0	-	Reserved
	[13]	R/W	0	-	Reserved
	[12:8]	R/W	0	-	Reserved
	[7]	R/W	0	BIT_PERI_GT7_CLK_SEL	GTIMER7 clock source 0: 32Khz, 1: 10Mhz
	[6]	R/W	0	BIT_PERI_GT6_CLK_SEL	GTIMER6 clock source 0: 32Khz, 1: 10Mhz
	[5]	R/W	0	BIT_PERI_GT5_CLK_SEL	GTIMER5 clock source 0: 32Khz, 1: 10Mhz

Offset	Bit	Access	INI	Symbol	Description
	[4]	R/W	0	BIT_PERI_GT4_CLK_SEL	GTIMER4 clock source 0: 32Khz, 1: 10Mhz
	[3]	R/W	0	BIT_PERI_GT3_CLK_SEL	GTIMER3 clock source 0: 32Khz, 1: 10Mhz
	[2]	R/W	0	BIT_PERI_GT2_CLK_SEL	GTIMER2 clock source 0: 32Khz, 1: 10Mhz
	[1]	R/W	0	BIT_PERI_GT1_CLK_SEL	GTIMER1 clock source 0: 32Khz, 1: 10Mhz
	[0]	R/W	0	BIT_PERI_GT0_CLK_SEL	GTIMER0 clock source 0: 32Khz, 1: 10Mhz

Table 13. Hardware Timer Range (Base Address: 0x4000_2000)

Address Range (Base+)	Function
0x00 to 0x10	Timer 1 register
0x14 to 0x24	Timer 2 register
0x28 to 0x38	Timer 3 register
0x3C to 0x4C	Timer 4 register
0x50 to 0x60	Timer 5 register
0x64 to 0x74	Timer 6 register
0x78 to 0x88	Timer 7 register
0x8C to 0x9C	Timer 8 register

Table 14. Hardware Timer (Base Address: 0x4000_2000)

Address Offset	Bit	Access	INI	Symbol	Description
TimerNLoadCount N=1..7					
0x00	[31:0]	R/W	0xffffffff	TimerN Load Count Register	Value to be loaded into TimerN. This is the value from which counting commences. Any value written to this register is loaded into the associated timer.
TimerNCurrentValue N=1..7					
0x04	[31:0]	R	0xffffffff	Timer N Current Value	Current Value of TimerN. This register is supported only when timer_N_clk is synchronous to pclk. Reading this register when using independent clocks results in an undefined value.
TimerNControlReg N=1..7					
0x08	[31:3]	-	-	-	Reserved
	[2]	R/W	-	Timer Interrupt Mask	Timer interrupt mask for TimerN. 0: Not masked 1: Masked
	[1]	R/W	-	Timer Mode	Timer mode for TimerN. 0: Free-running mode 1: User-defined count mode

Address Offset	Bit	Access	INI	Symbol	Description
	[0]	R/W	-	Timer Enable	Timer enable bit for TimerN. 0: Disable 1: Enable
TimerNEOI N=1..7					
0x0C	[31:1]	-	-	-	Reserved
	[0]	R	-	TimerN End-of-Interrupt Register	Reading from this register returns all zeroes (0) and clears the interrupt from TimerN.
TimerNIntStatus N=1..7					
0x10	[31:1]	-	-	-	Reserved
	[0]	R	-	TimerN Interrupt Status Register	Contains the interrupt status for TimerN.
TimersIntStatus					
0xA0	[7:0]	R	-	Timers Interrupt Status Register	Contains the interrupt status of all timers in the component. If a bit of this register is 0, then the corresponding timer interrupt is not active – and the corresponding interrupt could be on either the timer_intr bus or the timer_intr_n bus, depending on the interrupt polarity you have chosen. Similarly, if a bit of this register is 1, then the corresponding interrupt bit has been set in the relevant interrupt bus. In both cases, the status reported is the status after the interrupt mask has been applied. Reading from this register does not clear any active interrupts: 0: Either timer_intr or timer_intr_n is not active after masking 1: Either timer_intr or timer_intr_n is active after masking
TimersEOI					
0xA4	[7:0]	R	-	Timers End-of-Interrupt Register	Reading this register returns all zeroes (0) and clears all active interrupts.

7.6. Quadrature Decoder

A three axis (X, Y, and Z-axis) quadrature decoder is built into the RTL8762A. We implement a smart interrupt mechanism to reduce firmware loading. The RTL8762A embeds the input debounce circuitry with the programmable timer.

Table 15. Quadrature Decoder (Base Address: 0x4000_4000)

Offset	Bit	Access	INI	Symbol	Description
REG_00					
0x00	[31]	R	0	int_x	Interrupt for X-axis 1: Interrupt 0: No interrupt
	[30]	R	0	ov_flag_x	Overflow flag for accumulation counter for X-axis 0: No overflow occurred 1: Overflow occurred; 0xFFFF--> 0x0000
	[29]	R	0	step_2_flag_x	Illegal state flag for X-axis 0: No illegal state occurred 1: Illegal state occurred
	[28]	R	0	dir_x	Direction for X-axis 0: Down 1: Up
	[27]	R	0	ud_flag_x	Underflow flag for accumulation counter for X-axis 0: No underflow occurred 1: Underflow occurred; 0x0000--> 0xFFFF
	[23:16]	R	0	step_2_cntr_x	Step2 accumulation value for X-axis 0~255 Step is +1 This counter is for debug purpose. When state change is 2-bit toggle, this is an illegal state and the counter is increased by one.
	[15:0]	R	0	acc_cntr_x	Accumulation value for X-axis 0x0000 to 0xFFFF Step is +1 or -1 When direction is up, the counter is increased by one during each state change. When direction is down, the counter is decreased by one during each state change. The counter is a "wrap-around" type.
REG_04					
0x04	[31]	R	0	int_y	Interrupt for Y-axis 1: Interrupt 0: No interrupt
	[30]	R	0	ov_flag_y	Overflow flag for accumulation counter for Y-axis 0: No overflow occurred 1: Overflow occurred; 0xFFFF--> 0x0000

Offset	Bit	Access	INI	Symbol	Description
	[29]	R	0	step_2_flag_y	Illegal state flag for Y-axis 0: No illegal state occurred 1: Illegal state occurred
	[28]	R	0	dir_y	Direction for Y-axis 0: Down 1: Up
	[27]	R	0	ud_flag_y	Underflow flag for accumulation counter for Y-axis 0: No underflow occurred 1: Underflow occurred, 0x0000--> 0xFFFF
	[23:16]	R	0	step_2_cntr_y	Step2 accumulation value for Y-axis 0~255 Step is +1 This counter is for debug purposes. When state change is 2-bit toggle, this is an illegal state and the counter is increased by one.
	[15:0]	R	0	acc_cntr_y	Accumulation value for Y-axis 0x0000 to 0xFFFF Step is +1 or -1 When direction is up, the counter is increased by one during each state change. When direction is down, the counter is decrease by one during each state change. The counter is a 'wrap-around' type.
REG_08					
0x08	[31]	R	0	int_z	Interrupt for Z-axis 1: Interrupt 0: No interrupt
	[30]	R	0	ov_flag_z	Overflow flag for accumulation counter for Z-axis 0: No overflow occurred 1: Overflow occurred, 0xFFFF--> 0x0000
	[29]	R	0	step_2_flag_z	Illegal state flag for Z-axis 0: No illegal state occurred 1: Illegal state occurred
	[28]	R	0	dir_z	Direction for Z-axis 0: Down 1: Up
	[27]	R	0	ud_flag_z	Underflow flag for accumulation counter for Z-axis 0: No underflow occurred 1: Underflow occurred, 0x0000--> 0xFFFF
	[23:16]	R	0	step_2_cntr_z	Step2 accumulation value for Z-axis 0~255 Step is +1 This counter is for debug purpose. When state change is 2-bit toggle, this is an illegal state and the counter is increased by one.

Offset	Bit	Access	INI	Symbol	Description
	[15:0]	R	0	acc_cntr_z	Accumulation value for Z-axis 0x0000 to 0xFFFF Step is +1 or -1 When direction is up, the counter is increased by one during each state change. When direction is down, the counter is decrease by one during each state change. The counter is a 'wrap-around' type.
REG_0C					
0x0C	[27:16]	R/W	0xF9	reg_deb_time	SW must program debounce time before de-noise filter is enabled. The stable period=(reg_deb_time+1) * 1/(quad decoder sampling clock) Please refer 0x28 for the description of how to decide sampling clock of quad decoder
	[8]	R/W	0	reg_pause_en_z	0: Resume the accumulation counter 1: Pause the accumulation counter
	[7]	R/W	0	reg_pause_en_y	0: Resume the accumulation counter 1: Pause the accumulation counter
	[6]	R/W	0	reg_pause_en_x	0: Resume the accumulation counter 1: Pause the accumulation counter
	[5]	R/W	0	reg_dec_en_z	0: Disable quad decoder Z 1: Enable quad decoder Z
	[4]	R/W	0	reg_dec_en_y	0: Disable quad decoder Y 1: Enable quad decoder Y
	[3]	R/W	0	reg_dec_en_x	0: Disable quad decoder X 1: Enable quad decoder X
	[2]	R/W	0	reg_en_nfilter_z	1: Enable de-noise filter 0: only double sync phase_a_z & phase_b_z
	[1]	R/W	0	reg_en_nfilter_y	1: Enable de-noise filter 0: only double sync phase_a_y & phase_b_y
	[0]	R/W	0	reg_en_nfilter_x	1: Enable de-noise filter 0: Only double sync phase_a_x & phase_b_x
REG_10					
0x10	22	R	0x0	int_z	Interrupt for Z-axis 1: Interrupt 0: No interrupt
	21	R	0x0	int_y	Interrupt for Y-axis 1: Interrupt 0: No interrupt
	20	R	0x0	int_x	Interrupt for X-axis 1: Interrupt 0: No interrupt
	18	W	0x0	reg_int_z_clr	1: Clear interrupt of Z-axis
	17	W	0x0	reg_int_y_clr	1: Clear interrupt of Y-axis
	16	W	0x0	reg_int_x_clr	1: Clear interrupt of X-axis

7.8. Hardware KeyScan

The RTL8762A supports a programmable 8x20 key matrix with keyscan engine. All GPIOs can use pin multiplexing for easy configuration. The PAD structure is pull-high resistor.

Table 17. Hardware KeyScan (Base Address: 0x4000_6000)

Offset	Bit	Access	INI	Symbol	Description
0x00	[31]	R/W	0x0	reg_key_scan_clk_en	Enable internal key scan clock. Key scan clock enabling must be made after key scan configuration is done. 0x1: Enable key scan clock 0x0: Disable key scan clock
	[27:8]	R/W	0x0	reg_col_sel	The control register to define which column is used 0x0: No key column is select 0x1: key column 0 is select 0x2: key column 1 is select 0x3: key column 0 and column 1 are select 0x4: key column 2 is select ... 0xffff: key column 1 to column 19 are select 0xffff: key column 0 to column 19 are select
	[7:5]	R/W	0x0	reg_row_num	The control register to define how many key rows to use. E.g.: reg_row_num=0x0, only use one key row reg_row_num=0x1, use two key rows reg_row_num=0x7, use row0 ~ row7
	[4:0]	R/W	0x0	reg_col_num	The control register to define how many key columns to use. E.g.: reg_col_num=0x0, only use one key column reg_col_num=0x1, use two key columns reg_col_num=0x13, use column 0 ~ column 19
-					
0x04	[29:27]	R/W	0x3	reg_col_gt_post_sel	Post guard time for key column Post guard time=1/128e3 * reg_col_gt_post_sel
	[26:24]	R/W	0x03	reg_col_gt_pre_sel	Pre guard time for key column Pre guard time=1/128e3 * reg_col_gt_pre_sel
	[23:16]	R/W	0x0	reg_row_sel	The control register to define which row is used 0x0: No key row is selected 0x1: key row 0 is selected 0x2: key row 1 is selected 0x3: key row 0 and row 1 are selected 0x4: key row 2 is selected ... 0xff: key row 0 to row 7 are selected

Offset	Bit	Access	INI	Symbol	Description
	[10:8]	R/W	0x2	reg_totime_chk_sel	When in time-out state, HW detects key activity periodically 0x0: 5ms 0x1: 10ms 0x2: 20ms 0x3: 40ms 0x4: 80ms 0x5: 160ms 0x6: 320ms 0x7: 640ms

	[7]	R	-	fifo_we_reject_st	Flag to indicate any scan data is rejected 0x1: Reject occurred 0x0: No reject occurred
	[6]	R	-	fifo_we_ov_st	Flag to indicate FIFO is overflow 0x1: Overflow occurred 0x0: No overflow occurred
	[5]	R	-	fifo_full	Flag to indicate FIFO is full 0x1: FIFO is full 0x0: FIFO is not full
	[4]	R	-	fifo_empty	Flag to indicate FIFO is empty 0x1: FIFO is empty 0x0: FIFO is not empty

Offset	Bit	Access	INI	Symbol	Description
	[2:0]	R	-	current_state	Status of scan state 0x0: IDLE 0x1: INIT 0x2: SCAN 0x3: SCAN_EXT 0x4: SCAN_END 0x5: WAIT 0x6: TIME-OUT

7.9. AUXADC

AUXADC provides eight external channels and two internal channels with 12-bit sigma-delta ADC. The RTL8762A has a built-in Programmable Gain Amplifier (PGA), digital decimation filter, digital DC removal, and microphone bias. The RTL8762A natively supports analog and digital microphone. Additionally, the RTL8762A embeds an MSBC encoder. The MIC input data path is shown below. The PGA gain provides 8 configuration levels; 0 dB/14 dB/20 dB/24 dB/30 dB/35 dB/40 dB/44 dB/50 dB.

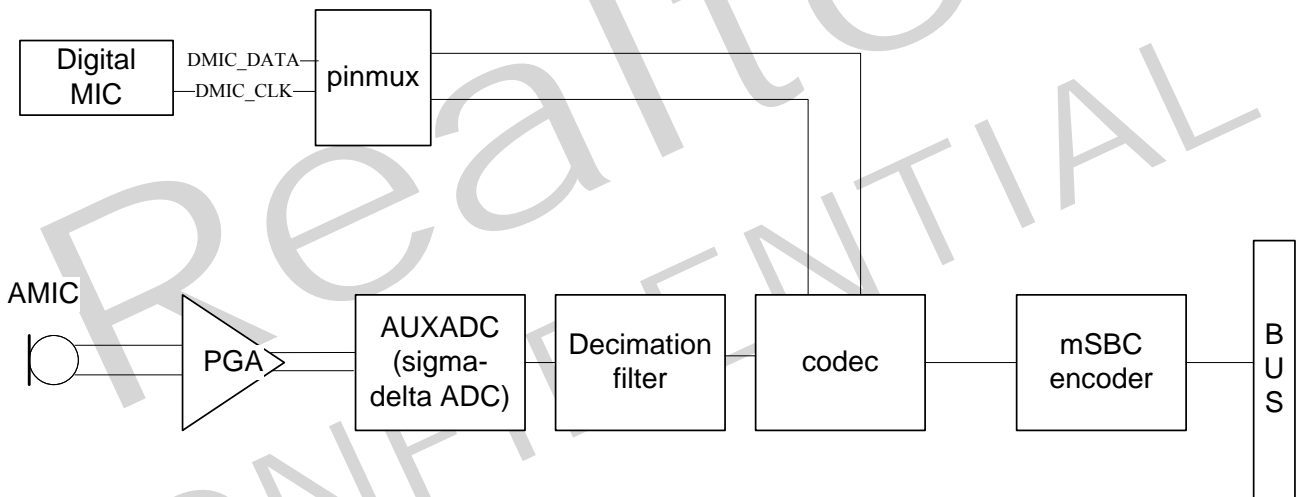

Figure 11. MIC Input Data Path

Table 18. AUXADC (Base Address: 0x4001_0000)

Offset	Bit	Access	INI	Symbol	Description

7.10. Data UART

Table 19. Data UART (Base Address: 0x4004_0000)

Offset	Bit	Access	INI	Symbol	Description
Divisor Latch (LS) Register					
0x00	[31:8]	R/W	-	-	Reserved
	[7:0]	R/W	0	DLL	Divisor [7:0]; accessible when DLAB=1
Divisor Latch (MS) Register					
0x01	[31:8]	R/W	-	-	Reserved
	[7:0]	R/W	0	DLM	Divisor [15:8]; accessible when DLAB=1
Interrupt Enable Register					
0x04	[31:8]	R/W	-	-	Reserved
	[7:4]	R/W	0	-	Reserved Should be logic 1'b0
	[3]	R/W	-	edssi	Enable Modem Status Interrupt (EDSSI) (modem status transition) 0: Disabled 1: Enabled
	[2]	R/W	0	elsi	Enable Receiver Line Status Interrupt (ELSI) (receiver line status) 0: Disabled 1: Enabled
	[1]	R/W	-	etbei	Enable Transmitter FIFO Empty interrupt (ETBEI) (tx FIFO empty) 0: Disabled 1: Enabled
	[0]	R/W	0	erbi	Enable Received Data Available Interrupt (ERBFI) (rx trigger or timeout) 0: Disabled 1: Enabled
Interrupt Identification Register					
0x08	[31:8]	R	-	-	Reserved
	[7]	R	0	fifo_en	fifo_en field of FCR bit[0]
	[6]	R	-	fifo_en	fifo_en field of FCR bit[0]
	[5:4]	R	0	RSVD	Enable Receiver Line Status Interrupt (ELSI) (receiver line status) 0: Disabled 1: Enabled

Offset	Bit	Access	INI	Symbol	Description
	[3:1]	R	-	int_id[2:0]	<p>Bit1 and Bit2, the two bits of the IIR, are used to identify the highest priority interrupt pending as indicated in the following table.</p> <p>Bit3: In FIFO mode this bit is set along with bit 2 when a timeout interrupt is pending</p> <p>Bit3~Bit1 displays the list of possible interrupts along with the bits they enable, priority, and their source and reset control.</p> <p>3'b011: Interrupt Priority: 1st priority (int_3) Interrupt Type: Receiver Line Status (read lsr) Interrupt Source: Parity, overrun, Framing errors, or break interrupt Interrupt Reset Control: Reading the Line Status Register</p> <p>3'b010: Interrupt Priority: 2nd priority Interrupt Type: Receiver Data Available or trigger level reached.(int_2) Interrupt source: FIFO Trigger level reached or rxfifo full Interrupt Reset Control: FIFO drops below trigger level (depends on FCR[7:6]: rcvr_trig 00: 1 01: 4 10: 8 11: 14) 3'b110: Interrupt Priority: 2nd priority Interrupt Type: Timeout Indication Interrupt source: There is at least 1 character in the FIFO but no character has been input to the FIFO or read from it for the last 4 character times. Interrupt Reset Control: Reading Receiver Buffer Register (RBR)</p> <p>3'b001: Interrupt Priority: 3rd priority Interrupt Type: Transmitter holding register TXFIFO empty Interrupt source: Transmitter holding register TXFIFO empty Interrupt Reset Control: Writing to the TXFIFO (THR)Transmitter Holding Register or reading IIR (if source of interrupt)</p> <p>3'b000: Interrupt Priority: 4th priority Interrupt Type: Modem Status Interrupt source: CTS, DSR, RI, or DCD (input relative signal) Interrupt Reset Control: Reading the Modem status register</p>
	[0]	R	0	int_pend	<p>Indicates that an interrupt is pending when it is logic '0'. When it is '1', no interrupt is pending</p> <p>0: An interrupt is pending and the IIR contents may be used as a pointer to the appropriate interrupt service routine</p> <p>1: No interrupt is pending</p>

Offset	Bit	Access	INI	Symbol	Description
FIFO Control Register					
0x08	[7:6]	R/W	-	rxfifo_trigger_level	Defines the 16-entries Receiver FIFO Interrupt trigger level 0~15 bytes 00: 1 byte 01: 4 bytes 10: 8 bytes 11: 14 bytes
	[5:4]	R/W	-	-	Reserved
	[3]	W	-	dma_mode	Supports DMA mode.
	[2]	W	-	clear_txfifo	Writing logic '1' to Bit 2 clears the Transmitter FIFO and resets its logic. The shift register is not cleared, i.e., transmitting of the current character continues. The 1 that is written to this bit position is self-clearing
	[1]	W	-	clear_rxfifo	Writing logic '1' to Bit 1 clears the Receiver FIFO and resets its logic, however it does not clear the shift register, i.e. receiving of the current character continues. The 1 that is written to this bit position is self-clearing
	[0]	W	-	fifo_en	FIFO enable Set to 1 for only enabling the report of Error in RCVR FIFO field in LSR bit [7], (in our application this is FIFO mode only)
Line Control Register					
0x0C	[31:8]	R/W	-	-	Reserved
	[7]	R/W	0	dlab	Divisor Latch Access bit 0: The divisor latches cannot be accessed 1: The divisor latches can be accessed <i>Note: DLL/DLM can only be accessed when dlab bit=1 IER can only be accessed when dlab bit=0 THR/RBR does not care about dlab bit value.</i>
	[6]	R/W	0	break_ctrl	Break Control bit 0: Break is disabled 1: The serial out is forced into logic '0' (break state). Break control bit causes a break condition to be transmitted to the receiving UART. When it is set to a logic 1, the serial output (Sout) is forced to the Spacing (logic 0) state. The break is disabled by setting bit 6 to logic 0. The Break Control bit acts only on SOUT and has no effect on the transmitter logic.
	[5]	R/W	0	stick_parity	Stick Parity bit. 1: Stick Parity bit at 1'b1 0: Stick Parity bit at 1'b0
	[4]	R/W	-	even_parity_sel	

Even Parity select.

Offset	Bit	Access	INI	Symbol	Description
					1: Even number of '1's is transmitted in each word.
	[3]	R/W	0	parity_en	Parity Enable 0: No parity 1: Parity bit is generated on each outgoing character and is checked on each incoming one.
	[2]	R/W	0	stb	This bit specifies the number of Stop bits transmitted and received in each serial character 0: No stop bits 1: 1 stop bits. Note that the receiver always checks the first stop bit only.
	[1]	R/W	-	Reserved	Even Parity select 0: Odd number of Logic '1' is transmitted and checked in each word (data and parity combined). In other words, if the data has an even number of '1' in it, then the parity bit is '1' 1: Even number of '1's is transmitted in each word.
	[0]	R/W	1	0 wls0	Word length selection 0, 0: data is 7-bit word length. 1: Data is 8-bit word length.
Modem Control Register					
0x10	[31:8]	-	-	-	Reserved
	[7:6]	R/W	0	-	Reserved
	[5]	R/W	0	autoflow_en	AutoFlow Enable (AFE) This Bit (AFE) is the auto flow control enable. When set, the autoflow control as described in the detailed description is enabled. In diagnostic mode, data that is transmitted is immediately received. This allows the CPU to verify the transmit and receive data paths. The receiver and transmitter interrupts are fully operational. The modem control interrupts are also operational, but the modem control interrupt's sources are now the lower four bits of the MCR instead of four modem control inputs. All interrupts are still controlled by the IER {AFE, RTS}: 2'b11: Auto-RTS_ and auto-CTS_ enabled (autoflow control enabled) 2'b10: Auto-CTS_ only enabled. 2'b0X: Auto-RTS_ and auto-CTS_ disabled <i>Note: Autoflow control is comprised of auto-CTS_ and auto-RTS_. With auto-CTS_, the CTS_ input must be active before the transmitter FIFO can emit data. With auto-RTS_, RTS_ becomes active when the receiver needs more data and notifies the sending serial device. When RTS_ is connected to CTS_, data transmission does not occur unless the receiver FIFO has space for the data; thus, overrun errors are eliminated with the autoflow control enabled. If not, overrun errors occurs when the transmit data rate</i>

Offset	Bit	Access	INI	Symbol	Description
					<p>exceeds the receiver FIFO read latency.</p> <p><i>Note: Auto-RTS_</i> <i>Auto-RTS_ data flow control originates in the receiver timing and control block and is linked to the programmed receiver FIFO trigger level. When the receiver FIFO level reaches a trigger level, RTS_ is de-asserted. The sending communication element may send an additional byte after the trigger level is reached (assuming the sending communication element has another byte to send) because it may not recognize the de-assertion of RTS_ until after it has begun sending the additional byte. RTS_ is automatically reasserted once the Receive FIFO is emptied.</i></p> <p><i>Note: Auto-CTS_ : The Transmitter circuitry checks CTS_ before sending the next data byte. When CTS_ is active, it sends the next byte. Top stops the transmitter from sending the following byte, CTS_ must be released before the middle of the last stop bit that is currently being sent. The auto-CTS_ function reduces interrupts to the host system. When flow control is enabled, CTS_ level changes do not trigger host interrupts because of the device automatically controls its own transmitter. Without auto-CTS_ , the transmitter sends any data present in the transmitter FIFO and a receiver overrun error may result.</i></p>
	[4]	R/W	0	loopback_en	<p>LoopBack mode 0: Normal operation 1: Loopback mode</p> <p>This bit provides a local loopback feature for diagnostic testing of the UART. When bit 4 is set to logic 1, the following occurs: the transmitter Serial Output (SOUT) is set to the Marking (logic 1) state; the receiver Serial Input (SIN) is disconnected; the output of the Transmitter Shift Register is 'looped back' into the Receiver Shift Register input; the four MODEM control inputs (DSR_, CTS_, RI_ and DCD_) are disconnected; the four MODEM Control output (DTR_, RTS_, OUT1_, and OUT2_) are internally connected to the four MODEM Control inputs, and the MODEM Control output pins are forced to their inactive state (high).</p> <p>In loopback mode, data that is transmitted is immediately received. This feature allows the processor to verify the transmit-and-received data paths of the UART.</p> <p>In loopback mode, the receiver and transmitter interrupts are fully operational. Their sources are external to the part. The MODEM Control interrupts are also operational, but the interrupts' sources are now the lower four bits of the MODEM Control Register instead of the four MODEM Control inputs. The interrupts are still controlled by the Interrupt Enable Register.</p>

Offset	Bit	Access	INI	Symbol	Description
	[3]	R/W	0	out2	Out2. This bit controls the output 2 (OUT2_) signal, which is an auxiliary user-designated output. Bit3 affects the OUT2_ output in a manner identical to that described above for bit 0. In loopback mode, connected to Data Carrier Detect (DCD)
	[2]	R/W	0	out1	Out1 This bit controls the Output 1 (OUT1_) signal, which is an auxiliary user-designated output. Bit 2 affects the OUT1_ in a manner identical to that described above for bit 0. In loopback mode, connected Ring Indicator (RI) signal input
	[1]	R/W	0	rts	Request to Send (RTS) signal control 0: RTS is logic 1 1: RTS is logic 0 This bit controls the Request to Send (RTS_) output. Bit 1 affects the RTS_ output in a manner identical to that described above for bit 0.
	[0]	R/W	0	dtr	Data Terminal Ready (DTR) signal control 0: DTR is logic 1 1: DTR is logic 0 This bit controls the Data Terminal Ready (DTR_) output. When bit 0 is set to a logic 1, the DTR_ output is forced to a logic 0. When bit0 is set to a logic 0, the DTR_ output is forced to a logic 1.
Line Status Register					
0x14	[31:8]	-	-	-	Reserved
	[7]	R	0	rxfifo_err	Uart_rx_error 1: In FIFO mode, this bit (LSR bit7) is set when there is at least a parity error, framing error, or break indication in the FIFO. LSR7 is clear when the CPU reads the LSR, if there are no subsequent errors in the FIFO.
	[6]	R	-	txfifo_empty	Transmitter Empty (TEMT) indicator (TXFIFO_empty) 0: Otherwise 1: This bit is set to logic 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty. It is reset to logic 0 whenever either the THR or TSR contains a data character. In FIFO mode this bit is set to one whenever the transmitter FIFO and shift register are both empty.
	[5]	R	0	txfifo_empty	TX FIFO empty indicator. 0: Otherwise 1: Indicates that the UART is ready to accept a new character for transmission. In addition, this bit causes the UART to issue an interrupt to the CPU when the Transmit Holding Register Empty Interrupt enable is set high. The THRE bit is set to logic 1 when a character is transferred from the Transmitter Holding Register into the Transmitter Shift Register

Offset	Bit	Access	INI	Symbol	Description
	[5]	R	0	txfifo_empty	The bit is reset to logic 0 concurrently with the loading of the Transmitter Holding Register by the CPU. In FIFO mode, this bit is set when the Transmitter FIFO is empty; it is cleared when at least 1 byte is written to the Transmitter FIFO.
	[4]	R	-	break_err_int	Break Interrupt (BI) indicator 0: No break condition in the current character 1: Set to logic 1 whenever the received data input is held in the Spacing (logic 0) state for a longer than a full word transmission time (that is, the total time of Start bit + data bits + Parity + Stop bits). The BI indicator is reset whenever the CPU reads the contents of the Line Status Register. This error is revealed to the CPU when its associated character is at the top of the FIFO. When a break occurs only one zero character is loaded into the FIFO. The next character transfer is enabled after Sin goes to the marking state (Logic 1) and receives the next valid start bit.
	[3]	R	0	framing_err	Framing Error (FE) indicator 0: No framing error in the current character 1: The received character at the top of the FIFO did not have a valid stop bit. Generally it indicates that all the following data is corrupt. Bit 3 is set to a logic 1 whenever the Stop bit following the last data bit or parity bit is detected as a logic 0 bit (Spacing level). The FE indicator is reset whenever the CPU reads the contents of the Line Status Register. This error is revealed to the CPU when its associated character is at the top of the FIFO. The UART will try to resynchronize after a framing error. To do this it assumes that the framing error was due to the next start bit, so it samples this 'start' bit twice and then takes in the 'data'
	[2]	R	0	parity_err	Parity Error (PE) indicator 0: No parity error in current character 1: Indicates that the received data character does not have the correct even or odd parity, as selected by the even-parity-select bit. The PE bit is set to a logic '1' upon detection of a parity error and is reset to logic 0 whenever the CPU reads the contents of the Line Status Register. In FIFO mode this error is associated with the particular character in the FIFO it applies to. This error is revealed to the CPU when its associated character is at the top of the FIFO (next character to be read).
	[1]	R	0	overrun_err	Overrun Error (OE) indicator 0: No Overrun state 1: Indicates that data in the RX FIFO was not read by the CPU before the next character was transferred into the RX FIFO, thereby destroying the previous character.

Offset	Bit	Access	INI	Symbol	Description
	[1]	R	0	overrun_err	The OE indicator is set to a logic 1 upon detection of an overrun condition and reset whenever the CPU reads the contents of the Line Status Register. If the FIFO mode data continues to fill the FIFO beyond the trigger level, an overrun error will occur only after the FIFO is full and the next character has been completely received in the shift register. OE is indicated to the CPU as soon as it occurs. The character in the shift register is overwritten, but it is not transferred to the FIFO.
	[0]	R	0	rxfifo_datardy	Data Ready (DR) indicator 0: No characters in the Receiver FIFO 1: At least one character has been received and transferred into the FIFO Bit0 is reset to logic '0' by reading all of the data in the Receiver Buffer Register or the RX FIFO.
Modem Status Register					
0x18	[7]	R	0	r_dcd	Complement of the DCD input or equals to Out2 in loopback mode.
	[6]	R	-	r_ri	Complement of the RI input or equals to Out1 in loopback mode.
	[5]	R	0	r_dsr	Complement of the DSR input or equals to DTR in loopback mode.
	[4]	R	-	r_cts	Complement of the CTS input or equals to RTS in loopback mode.
	[3]	R	-	d_dcd	Delta Data Carrier Detect (DDCD) indicator 1: The DCD line has changed its state 0: Otherwise.
	[2]	R	0	teri	Trailing Edge of Ring Indicator (TERI) detector. The RI line has changed its state from low to high state
	[1]	R	-	d_dsr	Delta Data Set Ready (DDSR) indicator 1: The DSR line has changed its state 0: Otherwise
	[0]	R	0	d_cts	Delta Clear to Send (DCTS) indicator 1: The CTS line has changed its state 0: Otherwise
Scratch Pad Register					
0x1C	[31:27]	R/W	0	-	Reserved
	[26:16]	R/W	-	xfactor_adj[10:0]	One factor of Baud rate calculation, i.e., the ovsr_adj[10:0] of the following formula.
	[15:12]	R/W	0	-	Reserved
	[11:8]	R/W	-	Dbg_sel[3:0]	Debug port selection
	[7]	R/W	-	rx break signal interrupt status	Write one to clear
	[6]	R/W	0	rx break signal interrupt enable	-
	[5]	R/W	-	fl_set_bi_err	Delta Data Set Ready (DDSR) indicator 1: The DSR line has changed its state 0: Otherwise

Offset	Bit	Access	INI	Symbol	Description
	[4]	R/W	0	fl_frame_err	Delta Clear to Send (DCTS) indicator 1: The CTS line has changed its state 0: Otherwise
	[3]	R/W	-	Pin_lb_test	For UART IP txd/rxd/rts/cts pin loopback test
	[2:0]	R/W	0	Reserved	Delta Clear to Send (DCTS) indicator 1: The CTS line has changed its state 0: Otherwise
STS Register					
0x20	[31:8]	R/W	0	-	Reserved
	[7:4]	R/W	-	xfactor	Factor of Baud rate calculation, i.e., the ovsr[3:0] of following formula.
	[3]	R/W	0	rx break signal interrupt enable	Reset UART Receiver
	[2:0]	R/W	-	-	Reserved

7.12. SPI0/SPI1

There are two individual SPI interfaces in the RTL8762A. SPI0 supports master and slave mode. SPI1 supports master mode only. The RTL8762A supports uni-directional 4 pin SPI (SPI_CLK, SPI_MISO, SsPI_MOSI, SPI_CS_N).

Table 21. SPI0/SPI1 (Base Address: 0x4000_1000)

Offset	Bit	Access	INI	Symbol	Description
0x308	[31:9]	-	-	-	Reserved
	[8]	R/W	0	SPI0_MASTER_MODE	SPI0 master mode select 0: Slave mode 1: Master mode
	[7:0]	-	-	-	Reserved

Table 22. SPI0/SPI1 (Base Address: 0x4004_2000)

Offset	Bit	Access	INI	Symbol	Description
CTRLR0: Control Register 0					
0x000 (SPI0) 0x400 (SPI1)	[15:11]	-	-	-	Reserved
	[10]	R/W	0x0	SLV_OE	Slave Output Enable. Relevant only when the DW_apb_ssi has been configured as a serial-slave device. When configured as a serial master, this bit field has no functionality. This bit enables or disables the setting of the ssi_oe_n output from the DW_apb_ssi serial slave. When SLV_OE=1, the ssi_oe_n output can never be active. When the ssi_oe_n output controls the tri-state buffer on the txd output from the slave, a high impedance state is always present on the slave txd output when SLV_OE=1. This is useful when the master transmits in broadcast mode (master transmits data to all slave devices). Only one slave may respond with data on the master rxd line. This bit is enabled after reset and must be disabled by software (when broadcast mode is used), if you do not want this device to respond with data. 0: Slave txd is enabled 1: Slave txd is disabled

Offset	Bit	Access	INI	Symbol	Description
	[9:8]	R/W	0x0	TMOD	<p>Transfer Mode. Selects the mode of transfer for serial communication. This field does not affect the transfer duplicity. Only indicates whether receive or transmit data are valid.</p> <p>In transmit-only mode, data received from the external device is not valid and is not stored in the receive FIFO memory; it is overwritten on the next transfer.</p> <p>In receive-only mode, transmitted data are not valid. After the first write to the transmit FIFO, the same word is retransmitted for the duration of the transfer.</p> <p>In transmit-and-receive mode, both transmit and receive data are valid. The transfer continues until the transmit FIFO is empty. Data received from the external device are stored into the receive FIFO memory, where it can be accessed by the host processor.</p> <p>In EEPROM-read mode, receive data is not valid while control data is being transmitted.</p> <p>When all control data is sent to the EEPROM, receive data becomes valid and transmit data becomes invalid. All data in the transmit FIFO is considered control data in this mode.</p> <p>This transfer mode is only valid when the DW_apb_ssi is configured as a master device.</p> <p>00: Transmit & Receive 01: Transmit Only 10: Receive Only 11: EEPROM Read</p>
	[7]	R/W	0x0	SCPOL	<p>Serial Clock Polarity. Valid when the frame format (FRF) is set to Motorola SPI. Used to select the polarity of the inactive serial clock, which is held inactive when the DW_apb_ssi master is not actively transferring data on the serial bus.</p> <p>0: Inactive state of serial clock is low 1: Inactive state of serial clock is high</p>
	[6]	R/W	0x0	SCPH	<p>Serial Clock Phase. Valid when the frame format (FRF) is set to Motorola SPI. The serial clock phase selects the relationship of the serial clock with the slave select signal. When SCPH=0, data are captured on the first edge of the serial clock. When SCPH=1, the serial clock starts toggling one cycle after the slave select line is activated, and data are captured on the second edge of the serial clock.</p> <p>0: Serial clock toggles in middle of first data bit 1: Serial clock toggles at start of first data bit</p>
	[5:4]	R/W	0x0	FRF	<p>Frame Format. Selects which serial protocol transfers the data.</p> <p>00: Motorola SPI 01: Reserved 10: Reserved 11: Reserved</p>

Offset	Bit	Access	INI	Symbol	Description
	[3:0]	R/W	0x7	DFS	Data Frame Size. Selects the data frame length. When the data frame size is programmed to be less than 16 bits, the receive data are automatically right-justified by the receive logic, with the upper bits of the receive FIFO zero-padded. 0000: Reserved – undefined operation 0001: Reserved – undefined operation 0010: Reserved – undefined operation 0011: 4-bit serial data transfer 0100: 5-bit serial data transfer 0101: 6-bit serial data transfer 0110: 7-bit serial data transfer 0111: 8-bit serial data transfer 1000: 9-bit serial data transfer 1001: 10-bit serial data transfer 1010: 11-bit serial data transfer 1011: 12-bit serial data transfer 1100: 13-bit serial data transfer 1101: 14-bit serial data transfer 1110: 15-bit serial data transfer 1111: 16-bit serial data transfer
CTRLR1: Control Register 1					
0x004 (SPI0) 0x404 (SPI1)	[15:0]	R/W	0x0	NDF	Number of Data Frames. When TMOD=10 or TMOD=11, this register field sets the number of data frames to be continuously received by the DW_apb_ssi. The DW_apb_ssi continues to receive serial data until the number of data frames received is equal to this register value plus 1, which enables you to receive up to 64KB of data in a continuous transfer. When the DW_apb_ssi is configured as a serial slave, the transfer continues for as long as the slave is selected. Therefore, this register serves no purpose and is not present when the DW_apb_ssi is configured as a serial slave.
SSIENR: SSI Enable Register					
0x008 (SPI0) 0x408 (SPI1)	[0]	R/W	0x00	SSI_EN	SSI Enable. Enables and disables all DW_apb_ssi operations. When disabled, all serial transfers are halted immediately. Transmit and receive FIFO buffers are cleared when the device is disabled. It is impossible to program some of the DW_apb_ssi control registers when enabled. When disabled, the ssi_sleep output is set (after delay) to inform the system that it is safe to remove the ssi_clk, thus saving power consumption in the system. Reset Value: 0x0

Offset	Bit	Access	INI	Symbol	Description
SER: Slave Enable Register					
0x010 (SPI0)	[31:8]	-	-	-	Reserved
	[7:0]	R/W	0x0	SER	<p>Slave Select Enable Flag. Each bit in this register corresponds to a slave select line (ss_x_n) from the DW_apb_ssi master. When a bit in this register is set (1), the corresponding slave select line from the master is activated when a serial transfer begins. Setting or clearing bits in this register has no effect on the corresponding slave select outputs until a transfer is started.</p> <p>Before beginning a transfer, you should enable the bit in this register that corresponds to the slave device with which the master wants to communicate.</p> <p>When not operating in broadcast mode, only one bit in this field should be set.</p> <p>1: Selected 0: Not Selected</p>
0x410 (SPI1)	[31:1]	-	-	-	Reserved
	[0]	-	-	SER	-
BAUDR: Baud Rate Select					
0x014 (SPI0) 0x414 (SPI1)	[15:0]	R/W	0x00	SCKDV	<p>SSI Clock Divider. The LSB for this field is always set to 0 and is unaffected by a write operation, which ensures an even value is held in this register. If the value is 0, the serial output clock (sclk_out) is disabled. The frequency of the sclk_out is derived from the following equation:</p> $F_{sclk_out} = F_{ssi_clk} / SCKDV$ <p>where SCKDV is any even value between 2 and 65534.</p> <p>For example: for Fssi_clk=3.6864MHz and SCKDV=2 Fsclk_out=3.6864/2=1.8432MHz</p>
TXFTLR: Transmit FIFO Threshold Level					
0x018 (SPI0) 0x418 (SPI1)	[31:5]	-	-	-	Reserved
	[4:0]	R/W	0x0	TFT	<p>Transmit FIFO Threshold. Controls the level of entries at which the transmit FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2~256; this register is sized to the number of address bits needed to access the FIFO.</p> <p>If you attempt to set this value greater than or equal to the depth of the FIFO, this field is not written and retains its current value.</p> <p>When the number of transmit FIFO entries is greater than or equal to this value + 1, the transmit FIFO full interrupt is triggered.</p>

Offset	Bit	Access	INI	Symbol	Description
RXFTHR: Receive FIFO Threshold Level					
0x01C (SPI0) 0x41C (SPI1)	[31:4]	-	-	-	Reserved
	[3:0]	R/W	0x0	RFT	Receive FIFO Threshold. Controls the level of entries at which the receive FIFO controller triggers an interrupt. The FIFO depth is configurable in the range 2~256. This register is sized to the number of address bits needed to access the FIFO. If you attempt to set this value greater than the depth of the FIFO, this field is not written and retains its current value. When the number of receive FIFO entries is greater than or equal to this value + 1, the receive FIFO full interrupt is triggered.
TXFLR: Transmit FIFO Level Register					
0x020 (SPI0) 0x4020 (SPI1)	[31:6]	-	-	-	Reserved
	[5:0]	R	0x0	TXTFL	Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.
RXFLR: Receive FIFO Level Register					
0x024 (SPI0) 0x424 (SPI1)	[31:5]	-	-	-	Reserved
	[4:0]	R	0x0	RXTFL	Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.
SR: Status Register					
0x028 (SPI0) 0x428 (SPI1)	[6]	R	0x0	DCOL	Data Collision Error. Relevant only when the DW_apb_ssi is configured as a master device. This bit is set if the DW_apb_ssi master is actively transmitting when another master selects this device as a slave. This informs the processor that the last data transfer was halted before completion. This bit is cleared when read. 0: No error 1: Transmit data collision error
	[5]	R	0x0	TXE	Transmission Error. Set if the transmit FIFO is empty when a transfer is started. This bit can be set only when the DW_apb_ssi is configured as a slave device. Data from the previous transmission is resent on the txd line. This bit is cleared when read. 0: No error 1: Transmission error
	[4]	R	0x0	RFF	Receive FIFO Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty locations, this bit is cleared. 0: Receive FIFO is not full 1: Receive FIFO is full
	[3]	R	0x0	RFNE	Receive FIFO Not Empty. Set when the receive FIFO contains one or more entries and is cleared when the receive FIFO is empty. This bit can be polled by software to completely empty the receive FIFO. 0: Receive FIFO is empty 1: Receive FIFO is not empty

Offset	Bit	Access	INI	Symbol	Description
	[2]	R	0x0	TFE	Transmit FIFO Empty. When the transmit FIFO is completely empty, this bit is set. When the transmit FIFO contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. 0: Transmit FIFO is not empty 1: Transmit FIFO is empty
	[1]	R	0x1	TFNF	Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. 0: Transmit FIFO is full 1: Transmit FIFO is not full
	[0]	R	0x0	BUSY	SSI Busy Flag. When set, indicates that a serial transfer is in progress; when cleared indicates that the DW_apb_ssi is idle or disabled. 0: DW_apb_ssi is idle or disabled 1: DW_apb_ssi is actively transferring data
IMR: Interrupt Mask Register					
0x02C (SPI0) 0x42C (SPI1)	[31:6]	-	-	-	Reserved
	[5]	R/W	0x1	MSTIM	Multi-Master Contention Interrupt Mask. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device. 0: ssi_mst_intr interrupt is masked 1: ssi_mst_intr interrupt is not masked
	[4]	R/W	0x1	RXFIM	Receive FIFO Full Interrupt Mask 0: ssi_rxf_intr interrupt is masked 1: ssi_rxf_intr interrupt is not masked
	[3]	R/W	0x1	RXOIM	Receive FIFO Overflow Interrupt Mask 0: ssi_rxo_intr interrupt is masked 1: ssi_rxo_intr interrupt is not masked
	[2]	R/W	0x1	RXUIM	Receive FIFO Underflow Interrupt Mask 0: ssi_rxu_intr interrupt is masked 1: ssi_rxu_intr interrupt is not masked
	[1]	R/W	0x1	TXOIM	Transmit FIFO Overflow Interrupt Mask 0: ssi_txo_intr interrupt is masked 1: ssi_txo_intr interrupt is not masked
	[0]	R/W	0x1	TXEIM	Transmit FIFO Empty Interrupt Mask 0: ssi_txe_intr interrupt is masked 1: ssi_txe_intr interrupt is not masked
ISR: Interrupt Status Register					
0x030 (SPI0) 0x430 (SPI1)	[31:6]	-	-	-	Reserved
	[5]	R	0x0	MSTIS	Multi-Master Contention Interrupt Status. This bit field is not present if the DW_apb_ssi is configured as a serial-slave device. 0: ssi_mst_intr interrupt not active after masking 1: ssi_mst_intr interrupt is active after masking
	[4]	R	0x0	RXFIS	Receive FIFO Full Interrupt Status 0: ssi_rxf_intr interrupt is not active after masking 1: ssi_rxf_intr interrupt is full after masking

Offset	Bit	Access	INI	Symbol	Description
	[3]	R	0x0	RXOIS	Receive FIFO Overflow Interrupt Status 0: ssi_rxo_intr interrupt is not active after masking 1: ssi_rxo_intr interrupt is active after masking

	[0]	R	0x0	TXEIR	Transmit FIFO Empty Raw Interrupt Status 0: ssi_txe_intr interrupt is not active prior to masking 1: ssi_txe_intr interrupt is active prior masking
TXOICR: Transmit FIFO Overflow Interrupt Clear Register					
0x038 0x438	[0]	R	0x0	TXOICR	Clear Transmit FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_txo_intr interrupt; writing has no effect.
RXOICR: Receive FIFO Overflow Interrupt Clear Register					
0x03C 0x43C	[0]	R	0x0	RXOICR	Clear Receive FIFO Overflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxo_intr interrupt; writing has no effect.
RXUICR: Receive FIFO Underflow Interrupt Clear Register					
0x040 (SPI0) 0x400 (SPI1)	[0]	R	0x0	RXUICR	Clear Receive FIFO Underflow Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_rxu_intr interrupt; writing has no effect.

Offset	Bit	Access	INI	Symbol	Description
MSTICR: Multi-Master Interrupt Clear Register					
0x044 0x444	[0]	R	0x0	MSTICR	Clear Multi-Master Contention Interrupt. This register reflects the status of the interrupt. A read from this register clears the ssi_mst_intr interrupt; writing has no effect.
ICR: Interrupt Clear Register					
0x048 (SPI0) 0x448 (SPI1)	[0]	R	0x0	ICR	Clear Interrupts. This register is set if any of the interrupts below are active. A read clears the ssi_txo_intr, ssi_rxu_intr, ssi_rxo_intr, and the ssi_mst_intr interrupts. Writing to this register has no effect.
DMACR: DMA Control Register					
0x04C (SPI0) 0x44C (SPI1)	[1]	R/W	0x0	TDMAE	Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel. 0: Transmit DMA disabled 1: Transmit DMA enabled
	[0]	R/W	0x0	RDMAE	Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel 0: Receive DMA disabled 1: Receive DMA enabled
DMATDLR: DMA Transmit Data Level					
0x050 (SPI0) 0x450 (SPI1)	[4:0]	R/W	0x0	DMATDL	Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE=1.
DMARDLR: DMA Receive Data Level					
0x054 (SPI0) 0x454 (SPI1)	[3:0]	R/W	0x0	DMARD	Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level=DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or above this field value + 1, and RDMAE=1.

7.13. I2C

There are two separate I2C interfaces in the RTL8762A. Each I2C interface is comprised of serial data line (SDA) and serial clock (SCL). Both I2C interfaces can be configured to master or slave mode.

Features:

- Supports standard mode (0~100kb/s) and fast mode (less than or equal to 400kb/s)
- 7/10 bit device address
- 7/10 bit combined format transfer
- Bulk transmit mode

Table 23. I2C (Base Address: 0x4004_4000(I2C0) & 0x4004_4400(I2C1))

Offset	Bit	Access	INI	Symbol	Description
IC_CON: I2C Control Register					
0x00	[15:7]	-	-	-	Reserved
	[6]	R/W	0x1	IC_SLAVE_DISABLE	<p>This bit controls whether I2C has its slave disabled. You have the choice of having the slave enabled or disabled after reset is applied, which means software does not have to configure the slave. By default, the slave is always enabled (in reset state as well).</p> <p>If you need to disable it after reset, set this bit to 1.</p> <p>If this bit is set (slave is disabled), DW_apb_i2c functions only as a master and does not perform any action that requires a slave.</p> <p>0: Slave is enabled 1: Slave is disabled</p>
	[5]	R/W	0x1	IC_RESTART_EN	<p>Determines whether RESTART conditions may be sent when acting as a master. Some older slaves do not support handling RESTART conditions; however, RESTART conditions are used in several DW_apb_i2c operations.</p> <p>0: Disable 1: Enable</p> <p>When the RESTART is disabled, the DW_apb_i2c master is incapable of performing the following functions:</p> <ul style="list-style-type: none"> • Sending a START BYTE • Performing any high-speed mode operation • Performing direction changes in combined format mode • Performing a read operation with a 10-bit address <p>By replacing RESTART condition followed by a STOP and a subsequent START condition, split operations are broken down into multiple DW_apb_i2c transfers. If the above operations are performed, it will result in setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register.</p>
	[4]	R	-	IC_10BITADDR_MASTER_rd_only	<p>The function of this bit is handled by bit 12 of IC_TAR register</p> <p>0: 7-bit addressing 1: 10-bit addressing</p>

Offset	Bit	Access	INI	Symbol	Description
	[3]	R/W	0x1	IC_10BITADDR_SLAVE	When acting as a slave, this bit controls whether the DW_apb_i2c responds to 7- or 10-bit addresses. 0: 7-bit addressing. The DW_apb_i2c ignores transactions that involve 10-bit addressing; for 7-bit addressing, only the lower 7 bits of the IC_SAR register are compared. 1: 10-bit addressing. The DW_apb_i2c responds to only 10-bit addressing transfers that match the full 10 bits of the IC_SAR register.
	[2:1]	R/W	0x3	SPEED	These bits control at which speed the DW_apb_i2c operates; its setting is relevant only if one is operating the DW_apb_i2c in master mode. 1: Standard mode (0 to 100 kbit/s) 2: Fast mode (≤ 400 kbit/s)
	[0]	R/W	0x1	MASTER_MODE	This bit controls whether the DW_apb_i2c master is enabled. 0: Master disabled 1: Master enabled
IC_TAR: I2C Target Address Register					
0x04	[15:13]	-	-	-	Reserved
	[12]	R/W	0x1	IC_10BITADDR_MASTER	This bit controls whether the DW_apb_i2c starts its transfers in 7-or 10-bit addressing mode when acting as a master. 0: 7-bit addressing 1: 10-bit addressing
	[11]	R/W	0x0	SPECIAL	This bit indicates whether software performs a General Call or START BYTE command. 0: Ignore bit 10 GC_OR_START and use IC_TAR normally 1: Perform special I2C command as specified in GC_OR_START bit
	[10]	R/W	0x0	GC_OR_START	If bit 11 (SPECIAL) is set to 1, then this bit indicates whether a General Call or START byte command is to be performed by the DW_apb_i2c. 0: General Call Address – after issuing a General Call, only writes may be performed. Attempting to issue a read command results in Setting bit 6 (TX_ABRT) of the IC_RAW_INTR_STAT register. The DW_apb_i2c remains in General Call mode until the SPECIAL bit value (bit 11) is cleared. 1: START BYTE

Offset	Bit	Access	INI	Symbol	Description
	[9:0]	R/W	10'h055	IC_TAR	This is the target address for any master transaction. When transmitting a General Call, these bits are ignored. To generate a START BYTE, the CPU needs to write only once into these bits.
IC_SAR: I2C Slave Address Register					
0x08	[15:10]	-	-	-	Reserved
	[9:0]	R/W	10'h055	IC_SAR	The IC_SAR holds the slave address when the I2C is operating as a slave. For 7-bit addressing, only IC_SAR[6:0] is used.
IC_HS_MADDR: I2C High Speed Master Mode Code Address Register					
0x0C	[15:3]	-	-	-	Reserved
	[2:0]	R/W	0x1	IC_HS_MAR	This bit field holds the value of the I2C HS mode master code. HS-mode master codes are reserved 8-bit codes (00001xxx) that are not used for slave addressing or other purposes. Each master has its unique master code; up to eight high-speed mode masters can be present on the same I2C bus system.
IC_DATA_CMD:					
0x10	[15:11]	-	-	-	Reserved
	[10]	W	-	RESTART	This bit controls whether a RESTART is issued before the byte is sent or received. 1: RESTART is issued before the data is sent/received (according to the value of CMD), regardless of whether or not the transfer direction is changing from the previous command. 0: RESTART is issued only if the transfer direction is changing from the previous command
	[9]	W	-	STOP	This bit controls whether a STOP is issued after the byte is sent or received. 1: STOP is issued after this byte, regardless of whether or not the TX FIFO is empty. If the TX FIFO is not empty, the master immediately tries to start a new transfer by issuing a START and arbitrating for the bus. 0: STOP is not issued after this byte, regardless of whether or not the TX FIFO is empty. If the TX FIFO is not empty, the master continues the current transfer by sending/receiving data bytes according to the value of the CMD bit. If the TX FIFO is empty, the master holds the SCL line low and stalls the bus until a new command is available in the TX FIFO.

Offset	Bit	Access	INI	Symbol	Description
	[8]	W	0x0	CMD	<p>This bit controls whether a read or a write is performed. This bit does not control the direction when the DW_apb_i2c acts as a slave. It controls only the direction when it acts as a master.</p> <p>1: Read 0: Write</p> <p>When a command is entered in the TX FIFO, this bit distinguishes the write and read commands. In slave-receiver mode, this bit is a 'don't care' because writes to this register are not required. In slave-transmitter mode, a '0' indicates that the data in IC_DATA_CMD is to be transmitted.</p> <p>When programming this bit, you should remember the following: attempting to perform a read operation after a General Call command has been sent results in a TX_ABRT interrupt (bit 6 of the IC_RAW_INTR_STAT register), unless bit 11 (SPECIAL) in the IC_TAR register has been cleared.</p> <p>If a '1' is written to this bit after receiving a RD_REQ interrupt, then a TX_ABRT interrupt occurs.</p>
	[7:0]	R/W	0x0	DAT	<p>This register contains the data to be transmitted or received on the I2C bus. If you are writing to this register and want to perform a read, bits 7:0 (DAT) are ignored by the DW_apb_i2c. However, when you read this register, these bits return the value of data received on the DW_apb_i2c interface.</p>
IC_SS_SCL_HCNT: Standard Speed I2C Clock SCL High Count Register					
0x14	[15:0]	R/W	16'h 0190	IC_SS_SCL_HCNT	<p>This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for standard speed.</p>
IC_SS_SCL_LCNT: Standard Speed I2C Clock SCL Low Count Register					
0x18	[15:0]	R/W	16'h 01d6	IC_SS_SCL_LCNT	<p>This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for standard speed.</p>
IC_FS_SCL_HCNT: Fast Speed I2C Clock SCL High Count Register					
0x1C	[15:0]	R/W	16'h 003c	IC_FS_SCL_HCNT	<p>This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock high-period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL.</p>

Offset	Bit	Access	INI	Symbol	Description
IC_FS_SCL_LCNT: Fast Speed I2C Clock SCL Low Count Register					
0x20	[15:0]	R/W	16'h 0082	IC_FS_SCL_LCNT	This register must be set before any I2C bus transaction can take place to ensure proper I/O timing. This register sets the SCL clock low period count for fast speed. It is used in high-speed mode to send the Master Code and START BYTE or General CALL.
IC_INTR_STAT: I2C Interrupt Status Register					
0x2C	[15:12]	-	-	-	Reserved
	[11]	R	0x0	R_GEN_CALL	See IC_RAW_INTR_STAT(0x34) for a detailed description of these bits
	[10]	R	0x0	R_START_DET	
	[9]	R	0x0	R_STOP_DET	
	[8]	R	0x0	R_ACTIVITY	
	[7]	R	0x0	R_RX_DONE	
	[6]	R	0x0	R_TX_ABRT	
	[5]	R	0x0	R_RD_REQ	
	[4]	R	0x0	R_TX_EMPTY	
	[3]	R	0x0	R_TX_OVER	
	[2]	R	0x0	R_RX_FULL	
	[1]	R	0x0	R_RX_OVER	
	[0]	R	0x0	R_RX_UNDER	
IC_INTR_MASK: I2C Interrupt Mask Register					
0x30	[15:12]	-	-	-	Reserved
	[11]	R/W	12'h8ff	M_GEN_CALL	These bits mask their corresponding interrupt status bits in the IC_INTR_STAT register.
	[10]	R/W		M_START_DET	
	[9]	R/W		M_STOP_DET	
	[8]	R/W		M_ACTIVITY	
	[7]	R/W		M_RX_DONE	
	[6]	R/W		M_TX_ABRT	
	[5]	R/W		M_RD_REQ	
	[4]	R/W		M_TX_EMPTY	
	[3]	R/W		M_TX_OVER	
	[2]	R/W		M_RX_FULL	
	[1]	R/W		M_RX_OVER	
	[0]	R/W		M_RX_UNDER	
-					
0x34	[15:12]	-	-	-	Reserved
	[11]	R	0x0	GEN_CALL	Set only when a General Call address is received and it is acknowledged. It stays set until it is cleared, either by disabling DW_apb_i2c or when the CPU reads bit 0 of the IC_CLR_GEN_CALL register. DW_apb_i2c stores the received data in the RX buffer.

Offset	Bit	Access	INI	Symbol	Description
	[10]	R	0x0	START_DET	Indicates whether a START or RESTART condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
	[9]	R	0x0	STOP_DET	Indicates whether a STOP condition has occurred on the I2C interface regardless of whether DW_apb_i2c is operating in slave or master mode.
	[8]	R	0x0	ACTIVITY	<p>This bit captures DW_apb_i2c activity and stays set until it is cleared. There are four ways to clear it:</p> <ul style="list-style-type: none"> Disabling the DW_apb_i2c Reading the IC_CLR_ACTIVITY register Reading the IC_CLR_INTR register System reset <p>Once this bit is set, it stays set unless one of the four methods is used to clear it. Even if the DW_apb_i2c module is idle, this bit remains set until cleared, indicating that there was activity on the bus.</p>
	[7]	R	0x0	RX_DONE	When the DW_apb_i2c is acting as a slave-transmitter, this bit is set to 1 if the master does not acknowledge a transmitted byte. This occurs on the last byte of the transmission, indicating that the transmission is done.
	[6]	R	0x0	TX_ABRT	<p>This bit indicates if DW_apb_i2c, as an I2C transmitter, is unable to complete the intended actions on the contents of the transmit FIFO. This situation can occur both as an I2C master or an I2C slave, and is referred to as a 'transmit abort'.</p> <p>When this bit is set to 1, the IC_TX_ABRT_SOURCE register indicates the reason why the transmit abort takes places.</p>
	[5]	R	0x0	RD_REQ	<p>This bit is set to 1 when DW_apb_i2c is acting as a slave and another I2C master is attempting to read data from DW_apb_i2c. The DW_apb_i2c holds the I2C bus in a wait state (SCL=0) until this interrupt is serviced, which means that the slave has been addressed by a remote master that is asking for data to be transferred.</p> <p>The processor must respond to this interrupt and then write the requested data to the IC_DATA_CMD register. This bit is set to 0 just after the processor reads the IC_CLR_RD_REQ register.</p>

Offset	Bit	Access	INI	Symbol	Description
	[4]	R	0x0	TX_EMPTY	<p>This bit is set to 1 when the transmit buffer is at or below the threshold value set in the IC_TX_TL register. It is automatically cleared by hardware when the buffer level goes above the threshold.</p> <p>When the IC_ENABLE bit 0 is 0, the TX FIFO is flushed and held in reset. There the TX FIFO looks like it has no data within it, so this bit is set to 1, provided there is activity in the master or slave state machines.</p> <p>When there is no longer activity, then with ic_en=0, this bit is set to 0.</p>
	[3]	R	0x0	TX_OVER	<p>Set during transmit if the transmit buffer is filled to IC_TX_BUFFER_DEPTH and the processor attempts to issue another I2C command by writing to the IC_DATA_CMD register.</p> <p>When the module is disabled, this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.</p>
	[2]	R	0x0	RX_FULL	<p>Set when the receive buffer reaches or goes above the RX_TL threshold in the IC_RX_TL register. It is automatically cleared by hardware when buffer level goes below the threshold.</p> <p>If the module is disabled (IC_ENABLE[0]=0), the RX FIFO is flushed and held in reset; therefore the RX FIFO is not full. So this bit is cleared once the IC_ENABLE bit 0 is programmed with a 0, regardless of ongoing activity.</p>
	[1]	R	0x0	RX_OVER	<p>Set if the receive buffer is completely filled to IC_RX_BUFFER_DEPTH and an additional byte is received from an external I2C device. The DW_apb_i2c acknowledges this, but any data bytes received after the FIFO is full are lost. If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.</p>
	[0]	R	0x0	RX_UNDER	<p>Set if the processor attempts to read the receive buffer when it is empty by reading from the IC_DATA_CMD register.</p> <p>If the module is disabled (IC_ENABLE[0]=0), this bit keeps its level until the master or slave state machines go into idle, and when ic_en goes to 0, this interrupt is cleared.</p>

Offset	Bit	Access	INI	Symbol	Description
IC_RX_TL: I2C Receive FIFO Threshold Register					
0x38	[15:8]	-	-	-	Reserved
	[7:0]	R/W	0xb	RX_TL	Receive FIFO Threshold Level. Controls the level of entries (or above) that triggers the RX_FULL interrupt (bit 2 in IC_RAW_INTR_STAT register)
IC_TX_TL: I2C Transmit FIFO Threshold Register					
0x3C	[15:8]	-	-	-	Reserved
	[7:0]	R/W	0x3	TX_TL	Transmit FIFO Threshold Level. Controls the level of entries (or below) that trigger the TX_EMPTY interrupt (bit 4 in IC_RAW_INTR_STAT register).
IC_CLR_INTR: Clear Combined and Individual Interrupt Register					
0x40	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_INTR	Read this register to clear the combined interrupt, all individual interrupts, and the IC_TX_ABORT_SOURCE register. This bit does not clear hardware clearable interrupts but software clearable interrupts.
IC_CLR_RX_UNDER: Clear RX_UNDER Interrupt Register					
0x44	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_RX_UNDER	Read this register to clear the RX_UNDER interrupt (bit 0) of the IC_RAW_INTR_STAT register.
IC_CLR_RX_OVER: Clear RX_OVER Interrupt Register					
0x48	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_RX_OVER	Read this register to clear the RX_OVER interrupt (bit 1) of the IC_RAW_INTR_STAT register.
IC_CLR_TX_OVER: Clear TX_OVER Interrupt Register					
0x4C	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_TX_OVER	Read this register to clear the TX_OVER interrupt (bit 3) of the IC_RAW_INTR_STAT register.
IC_CLR_RD_REQ: Clear RD_REQ Interrupt Register					
0x50	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_RD_REQ	Read this register to clear the RD_REQ interrupt (bit 5) of the IC_RAW_INTR_STAT register.

Offset	Bit	Access	INI	Symbol	Description
IC_CLR_TX_ABORT: Clear TX_ABORT Interrupt Register					
0x54	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_TX_ABORT	Read this register to clear the TX_ABORT interrupt (bit 6) of the IC_RAW_INTR_STAT register, and the IC_TX_ABORT_SOURCE register. This also releases the TX FIFO from the flushed/reset state, allowing more writes to the TX FIFO. Refer to Bit 9 of the IC_TX_ABORT_SOURCE register for an exception to clearing IC_TX_ABORT_SOURCE.
IC_CLR_RX_DONE: Clear RX_DONE Interrupt Register					
0x58	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_RX_DONE	Read this register to clear the RX_DONE interrupt (bit 7) of the IC_RAW_INTR_STAT register.
IC_CLR_ACTIVITY: Clear ACTIVITY Interrupt Register					
0x5C	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_ACTIVITY	Reading this register clears the ACTIVITY interrupt if the I2C is not active anymore. If the I2C module is still active on the bus, the ACTIVITY interrupt bit continues to be set. It is automatically cleared by hardware if the module is disabled and if there is no further activity on the bus. The value read from this register gets the status of the ACTIVITY interrupt (bit 8) of the IC_RAW_INTR_STAT register.
IC_CLR_STOP_DET: Clear STOP_DET Interrupt Register					
0x60	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_STOP_DET	Read this register to clear the STOP_DET interrupt (bit 9) of the IC_RAW_INTR_STAT register.
IC_CLR_START_DET: Clear START_DET Interrupt Register					
0x64	[15:1]	-	-	-	-
	[0]	R	0x0	CLR_START_DET	Read this register to clear the START_DET interrupt (bit 10) of the IC_RAW_INTR_STAT register.
IC_CLR_GEN_CALL: Clear GEN_CALL Interrupt Register					
0x68	[15:1]	-	-	-	Reserved
	[0]	R	0x0	CLR_GEN_CALL	Read this register to clear the GEN_CALL interrupt (bit 11) of IC_RAW_INTR_STAT register.

Offset	Bit	Access	INI	Symbol	Description
IC_ENABLE: I2C Enable Register					
0x6C	[15:1]	-	-	-	-
	[0]	R/W	0x0	ENABLE	Controls whether the DW_apb_i2c is enabled. 0: Disables DW_apb_i2c (TX and RX FIFOs are held in an erased state) 1: Enables DW_apb_i2c Software can disable DW_apb_i2c while it is active.
IC_STATUS: I2C Status Register					
0x70	[31:7]	-	-	-	Reserved
	[6]	R	0x0	SLV_ACTIVITY	Slave FSM Activity Status. When the Slave Finite State Machine (FSM) is not in the IDLE state, this bit is set. 0: Slave FSM is in IDLE state so the Slave part of DW_apb_i2c is not Active 1: Slave FSM is not in IDLE state so the Slave part of DW_apb_i2c is Active
	[5]	R	0x0	MST_ACTIVITY	Master FSM Activity Status. When the Master Finite State Machine (FSM) is not in the IDLE state, this bit is set. 0: Master FSM is in IDLE state so the Master part of DW_apb_i2c is not Active 1: Master FSM is not in IDLE state so the Master part of DW_apb_i2c is Active
	[4]	R	0x0	RFF	Receive FIFO Completely Full. When the receive FIFO is completely full, this bit is set. When the receive FIFO contains one or more empty location, this bit is cleared. 0: Receive FIFO is not full 1: Receive FIFO is full
	[3]	R	0x0	RFNE	Receive FIFO Not Empty. This bit is set when the receive FIFO contains one or more entries; it is cleared when the receive FIFO is empty. 0: Receive FIFO is empty 1: Receive FIFO is not empty
	[2]	R	0x1	TFE	Transmit FIFO Completely Empty. When the transmit FIFO is completely empty, this bit is set. When it contains one or more valid entries, this bit is cleared. This bit field does not request an interrupt. 0: Transmit FIFO is not empty 1: Transmit FIFO is empty
	[1]	R	0x1	TFNF	Transmit FIFO Not Full. Set when the transmit FIFO contains one or more empty locations, and is cleared when the FIFO is full. 0: Transmit FIFO is full 1: Transmit FIFO is not full
	[0]	-	-	-	-

Offset	Bit	Access	INI	Symbol	Description
	[0]	R	0x0	ACTIVITY	I2C Activity Status.
IC_TXFLR: I2C Transmit FIFO Level Register					
0x74	[31:6]	-	-	-	Reserved
	[5:0]	R	0x0	TXFLR	Transmit FIFO Level. Contains the number of valid data entries in the transmit FIFO.
IC_RXFLR: I2C Receive FIFO Level Register					
0x78	[31:5]	-	-	-	-
	[4:0]	R	0x0	RXFLR	Receive FIFO Level. Contains the number of valid data entries in the receive FIFO.
IC_SDA_HOLD: I2C SDA Hold Time Length Register					
0x7C	[31:16]	-	-	-	Reserved
	[15:0]	R/W	16'h0001	IC_SDA_HOLD	Sets the required SDA hold time in units of ic_clk period.
IC_TX_ABRT_SOURCE: I2C Transmit Abort Source Register					
0x80	[31:16]	-	-	-	Reserved
	[15]	R	0x0	ABRT_SLVRD_INTX	1: When the processor side responds to a slave mode request for data to be transmitted to a remote master and user, writes a 1 in CMD (bit 8) of IC_DATA_CMD register.
	[14]	R	0x0	ABRT_SLV_ARBLOST	1: Slave lost the bus while transmitting data to a remote master. IC_TX_ABRT_SOURCE[12] is set at the same time.
	[13]	R	0x0	ABRT_SLVFLUSH_TXFIFO	1: Slave has received a read command and some data exists in the TX FIFO, so the slave issues a TX_ABRT interrupt to flush old data in TX FIFO.
	[12]	R	0x0	ARB_LOST	1: Master has lost arbitration, or if IC_TX_ABRT_SOURCE[14] is also set, then the slave transmitter has lost arbitration.
	[11]	R	0x0	ABRT_MASTER_DIS	1: User tried to initiate a Master operation with the Master mode disabled.
	[10]	R	0x0	ABRT_10B_RD_NORSTR	1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5])=0) and the master sends a read command in 10-bit addressing mode.

Offset	Bit	Access	INI	Symbol	Description
	[9]	R	0x0	ABRT_SBYTE_NORSTRT	<p>To clear Bit 9, the source of the ABRT_SBYTE_NORSTRT must be fixed first; restart must be enabled (IC_CON[5]=1), the SPECIAL bit must be cleared (IC_TAR[11]), or the GC_OR_START bit must be cleared (IC_TAR[10]).</p> <p>Once the source of the ABRT_SBYTE_NORSTRT is fixed, then this bit can be cleared in the same manner as other bits in this register. If the source of the ABRT_SBYTE_NORSTRT is not fixed before attempting to clear this bit, bit 9 clears for one cycle and then gets re-asserted.</p> <p>1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5])=0) and the user is trying to send a START Byte.</p>
	[8]	R	0x0	ABRT_HS_NORSTRT	1: The restart is disabled (IC_RESTART_EN bit (IC_CON[5])=0) and the user is trying to use the master to transfer data in High Speed mode.
	[7]	R	0x0	ABRT_SBYTE_ACKDET	1: Master has sent a START Byte and the START Byte was acknowledged (wrong behavior).
	[6]	R	0x0	ABRT_HS_ACKDET	1: Master is in High Speed mode and the High Speed Master code was acknowledged (wrong behavior).
	[5]	R	0x0	ABRT_GCALL_READ	1: DW_apb_i2c in master mode sent a General Call but the user programmed the byte following the General Call to be a read from the bus (IC_DATA_CMD[9] is set to 1).
	[4]	R	0x0	ABRT_GCALL_NOACK	1: DW_apb_i2c in master mode sent a General Call and no slave on the bus acknowledged the General Call.
	[3]	R	0x0	ABRT_TXDATA_NOACK	1: This is a master-mode only bit. Master has received an acknowledgement for the address, but when it sent data byte(s) following the address, it did not receive an acknowledge from the remote slave(s).
	[2]	R	0x0	ABRT_10ADDR2_NOACK	1: Master is in 10-bit address mode and the second address byte of the 10-bit address was not acknowledged by any slave.
	[1]	R	0x0	ABRT_10ADDR1_NOACK	1: Master is in 10-bit address mode and the first 10-bit address byte was not acknowledged by any slave.
	[0]	R	0x0	ABRT_7B_ADDR_NOACK	1: Master is in 7-bit addressing mode and the address sent was not acknowledged by any slave.

Offset	Bit	Access	INI	Symbol	Description
IC_SLV_DATA_NACK_ONLY: Generate Slave Data NACK Register					
0x84	[31:1]	-	-	-	Reserved
	[0]	R/W	0x0	NACK	<p>Generate NACK. This NACK generation only occurs when DW_apb_i2c is a slave-receiver. If this register is set to a value of 1, it can only generate a NACK after a data byte is received; hence, the data transfer is aborted and the data received is not pushed to the receive buffer.</p> <p>When the register is set to a value of 0, it generates NACK/ACK, depending on normal criteria.</p> <p>1: Generate NACK after data byte received 0: Generate NACK/ACK normally</p>
IC_DMA_CR: DMA Control Register					
0x88	[31:2]	-	-	-	Reserved
	[1]	R/W	0x0	TDMAE	<p>Transmit DMA Enable. This bit enables/disables the transmit FIFO DMA channel.</p> <p>0: Transmit DMA disabled 1: Transmit DMA enabled</p>
	[0]	R/W	0x0	RDMAE	<p>Receive DMA Enable. This bit enables/disables the receive FIFO DMA channel.</p> <p>0: Receive DMA disabled 1: Receive DMA enabled</p>
IC_DMA_TDLR: DMA Transmit Data Level Register					
0x8C	[31:5]	-	-	-	Reserved
	[4:0]	R/W	0x0	DMATDL	<p>Transmit Data Level. This bit field controls the level at which a DMA request is made by the transmit logic. It is equal to the watermark level; that is, the dma_tx_req signal is generated when the number of valid data entries in the transmit FIFO is equal to or below this field value, and TDMAE=1.</p>
IC_DMA_RDLR: I2C Receive Data Level Register					
0x90	[31:4]	-	-	-	Reserved
	[3:0]	R/W	0x00	DMARDL	<p>Receive Data Level. This bit field controls the level at which a DMA request is made by the receive logic. The watermark level =DMARDL+1; that is, dma_rx_req is generated when the number of valid data entries in the receive FIFO is equal to or more than this field value + 1, and RDMAE =1.</p> <p>For instance, when DMARDL is 0, then dma_rx_req is asserted when 1 or more data entries are present in the receive FIFO.</p>

Offset	Bit	Access	INI	Symbol	Description
IC_SDA_SETUP: I2C SDA Setup Register					
0x94	[31:8]	-	-	-	Reserved
	[7:0]	R/W	0x64	SDA_SETUP	SDA Setup. We recommend that if the required delay is 1000ns, then for an ic_clk frequency of 10MHz, IC_SDA_SETUP should be programmed to a value of 11. IC_SDA_SETUP must be programmed with a minimum value of 2.
IC_ACK_GENERAL_CALL: I2C ACK General Call Register					
0x98	[31:1]	-	-	-	Reserved
	[0]	R/W	0x1	ACK_GEN_CALL	ACK General Call. When set to 1, DW_apb_i2c responds with a ACK (by asserting ic_data_oe) when it receives a General Call. When set to 0, the DW_apb_i2c does not generate General Call interrupts.
IC_EN: ABLE_STATUS: I2C Enable Status Register					
0x9C	[31:3]	-	-	-	Reserved
	[2]	R	0x0	SLV_RX_DATA_LOST	Slave Received Data Lost. This bit indicates if a Slave-Receiver operation has been aborted with at least one data byte received from an I2C transfer due to the setting of IC_ENABLE from 1 to 0.
	[1]	R	0x0	SLV_DISABLED_WHILE_BUSY	Slave Disabled While Busy (Transmit, Receive). This bit indicates if a potential or active Slave operation has been aborted due to the setting of the IC_ENABLE register from 1 to 0. This bit is set when the CPU writes a 0 to the IC_ENABLE register while: (a) DW_apb_i2c is receiving the address byte of the Slave-Transmitter operation from a remote master; OR, (b) address and data bytes of the Slave-Receiver operation from a remote master.
	[0]	R	0x0	IC_EN	ic_en Status. This bit always reflects the value driven on the output port ic_en. When read as 1, DW_apb_i2c is deemed to be in an enabled state. When read as 0, DW_apb_i2c is deemed completely inactive.

7.14. UART

There are three UARTs for different scenarios; LOG_UART, HCI_UART, and DATA_UART. LOG_UART is for firmware debug. HCI_UART is for the MUTE interface, RF test, and image download. DATA_UART is a general UART.

The RTL8762A UART interface is a standard 4-wire interface with RX, TX, CTS, and RTS. The HCI UART interface supports the Bluetooth 2.0 UART HCI H4 and H5 specifications. The default baud rate is 115.2 kbaud.

The RTL8762A provides multiple UART baud-rate configured by register setting. The common band-rate example is shown in Table 24 below. The UART can function between two devices and has a clock error within $\pm 2.5\%$.

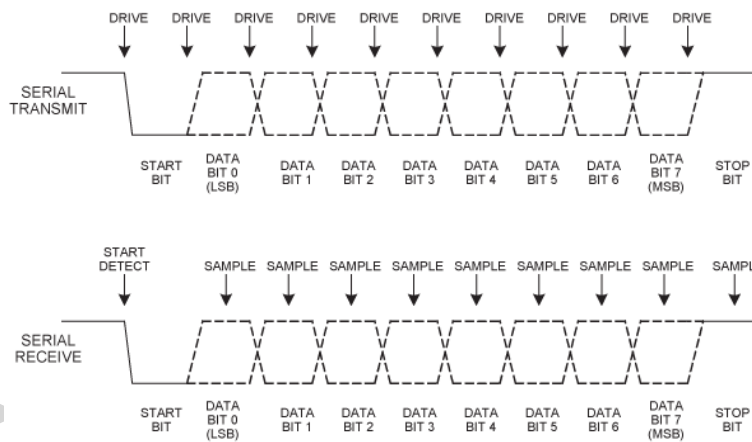

Figure 12. UART Waveform

Table 24. UART BaudRate

BaudRate (bps)	Error (%)	BaudRate (bps)	Error (%)
1200	-0.11	460800	0.16
9600	0.26	500000	0.00
14400	0.28	921600	-0.41
19200	-0.31	1000000	0.00

0x18	[63:32]	-	-	-	Reserved
	[b:32]	R/W	-	BLOCK_TS	<p>Block Transfer Size.</p> <p>When the RTK_ocp_dmac is the flow controller, the user writes this field before the channel is enabled in order to indicate the block size.</p> <p>The number programmed into BLOCK_TS indicates the total number of single transactions to perform for every block transfer; a single transaction is mapped to a single OCP beat.</p> <p>Width: The width of the single transaction is determined by CTLx.SRC_TR_WIDTH.</p> <p>Once the transfer starts, the read-back value is the total number of data items already read from the source peripheral, regardless of the flow controller.</p> <p>When the source or destination peripheral is assigned as the flow controller, then the maximum block size that can be read back saturates at DMAC_CHx_MAX_BLK_SIZE, but the actual block size can be greater.</p> <p>$b = \log_2(\text{DMAC_CHx_MAX_BLK_SIZE} + 1) + 31$</p> <p>Bits 43:b+1 do not exist and return 0 on a read.</p>
	[31:23]	-	-	-	Reserved
	[22:20]	R/W	-	TT_FC	<p>Transfer Type and Flow Control. The following transfer types are Supported:</p> <ul style="list-style-type: none"> • Memory to Memory • Memory to Peripheral • Peripheral to Memory • Peripheral to Peripheral <p>Flow Control can be assigned to the RTK_ocp_dmac, the source peripheral, or the destination peripheral</p>
	[19:17]	-	-	-	Reserved
	[16:14]	R/W	-	SRC_MSIZ	<p>Source Burst Transaction Length.</p> <p>Number of data items, each of width CTLx.SRC_TR_WIDTH, to be read from the source each time a source burst transaction request is made from either the corresponding hardware or software handshaking interface</p>

Offset	Bit	Access	INI	Symbol	Description
	[13:11]	R/W	-	DEST_MSIZ _E	Destination Burst Transaction Length. Number of data items, each of width CTLx.DST_TR_WIDTH, to be written to the destination each time a destination burst transaction request is made from either the corresponding hardware or software handshaking interface.
	[10:9]	R/W	-	SINC	Source Address Increment. Indicates whether to increment the source address on every source transfer. If the device is fetching data from a source peripheral FIFO with a fixed address, then set this field to 'No change'. 00: Increment 01: Decrement 1x: No change
	[8:7]	R/W	-	DINC	Destination Address Increment. Indicates whether to increment destination address on every destination transfer. If your device is writing data to a destination peripheral FIFO with a fixed address, then set this field to 'No change'. 00: Increment 01: Decrement 1x: No change
	[6:4]	R/W	-	SRC_TR_WIDTH	Source Transfer Width.
	[3:1]	R/W	-	DST_TR_WIDTH	Destination Transfer Width.
	[0]	R/W	-	INT_EN	Interrupt Enable Bit. If set, then all interrupt-generating sources are enabled. Functions as a global mask bit for all interrupts for the channel; raw* interrupt registers still assert if CTLx.INT_EN=0.
Reserved					
0x20	[63:0]	-	-	-	Reserved
Reserved					
0x28	[63:0]	-	-	-	Reserved

CFGx x can be 0, 1, 2, 3, 4, 5					
0x40	[63:43]	-	-	-	Reserved
	[b:43]	R/W	-	DEST_PER	Assigns a hardware handshaking interface (0 - DMAC_NUM_HS_INT-1) to the destination of channel x if the CFGx.HS_SEL_DST field is 0; otherwise, this field is ignored. The channel can then communicate with the destination peripheral connected to that interface through the assigned hardware handshaking interface.
	[b:39]	R/W	-	SRC_PER	Assigns a hardware handshaking interface (0 - DMAC_NUM_HS_INT-1) to the source of channel x if the CFGx.HS_SEL_SRC field is 0; otherwise, this field is ignored. The channel can then communicate with the source peripheral connected to that interface through the assigned hardware handshaking interface.
	[31]	R/W	-	RELOAD_DST	Automatic Destination Reload. The DARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. This register does not exist if the configuration parameter DMAC_CHx_MULTI_BLK_EN is not selected; in this case, the read-back value is always 0.
	[30]	R/W	-	RELOAD_SRC	Automatic Source Reload. The SARx register can be automatically reloaded from its initial value at the end of every block for multi-block transfers. A new block transfer is then initiated. This field does not exist if the configuration parameter DMAC_CHx_MULTI_BLK_EN is not selected; in this case, the read-back value is always 0.
	[29:20]	-	-	-	Reserved
	[19]	R/W	-	SRC_HS_POL	Source Handshaking Interface Polarity. 0: Active high 1: Active low
	[18]	R/W	-	DST_HS_POL	Destination Handshaking Interface Polarity. 0: Active high 1: Active low
	[17:12]	-	-	-	Reserved

Offset	Bit	Access	INI	Symbol	Description
	[11]	-	-	HS_SEL_SRC	Source Software or Hardware Handshaking Select. This register selects which of the handshaking interfaces – hardware or software – is active for source requests on this channel. 0: Hardware handshaking interface. Software-initiated transaction requests are ignored. 1: Software handshaking interface. Hardware-initiated transaction requests are ignored. If the source peripheral is memory, then this bit is ignored.
	[10]	-	-	HS_SEL_DST	Destination Software or Hardware Handshaking Select. This register selects which of the handshaking interfaces – hardware or software – is active for destination requests on this channel. 0: Hardware handshaking interface. Software-initiated transaction requests are ignored. 1: Software handshaking interface. Hardware-initiated transaction requests are ignored. If the destination peripheral is memory, then this bit is ignored.
	[9]	R/W	-	FIFO_EMPTY	Indicates if there is data left in the channel FIFO. Can be used in conjunction with CFGx.CH_SUSP to cleanly disable a channel. 1: Channel FIFO empty 0: Channel FIFO not empty
	[8]	-	-	-	Reserved
	[7:5]	-	-	CH_PRIOR	Channel priority. A priority of 7 is the highest priority, and 0 is the lowest. This field must be programmed within the following range: 0: (DMAH_NUM_CHANNELS – 1)
	[4:0]	-	-	-	Reserved

Parameter	Condition	Min	Typical	Max
For Analog MIC Mode				
Signal to noise ratio (dB)	1. Does not take into account harmonic 2. -6dBFS 3. Test at 1kHz tone 4. Differential mode	-	71.9	-

8.9. Radio Characteristics

Table 35. General Radio Characteristics

Parameter	Condition	Minimum	Typical	Maximum
Frequency Range (MHz)	-	2402	-	2480

Table 36. RX Performance

Parameter	Condition	Minimum	Typical	Maximum
Sensitivity (dBm)	PER \leq 30.8%	-94.5(note)	-	-
Maximum Input Level (dBm)	PER \leq 30.8%	-	-1	-
C/I	C/I _{co-channel} (dB)	-	6	-
	C/I _{+1MHz} (dB)	-	-9	-
	C/I _{-1MHz} (dB)	-	-8	-
	C/I _{+2MHz} (dB)	-	-38	-
	C/I _{-2MHz} (dB)	-	-32	-
	C/I _{+3MHz} (dB)	-	-41	-
	C/I _{image} (dB)	-	-26	-
	C/I _{image+1MHz} (dB)	-	-32	-
	C/I _{image-1MHz} (dB)	-	-42	-
Blocker Power (dBm)	30~2000MHz, Wanted signal level = -67dBm	-30	-	-
	2003~2399MHz, Wanted signal level = -67dBm	-35	-	-
	2484~2997MHz, Wanted signal level = -67dBm	-35	-	-
	3000MHz~12.75GHz, Wanted signal level = -67dBm	-30	-	-
Max PER Report Integrity	Wanted signal: -30dBm	-	50%	-
Max Intermodulation level (dBm)	Wanted signal (f ₀): -64dBm Worst intermodulation level @2f ₁ -f ₂ =f ₀ , f ₁ -f ₂ =n MHz, n=3, 4, 5...	-50	-	-

Note: 1. Does not include spur channel

Note: 2. Depends on PCB design and registers setting

Table 37. TX Performance

Parameter	Condition	Minimum	Typical	Maximum
Maximum Output Power (dBm)	-	-	0	-
Adjacent Channel Power Ratio (dBm)	+2MHz	-	-	-20
	-2MHz	-	-	-20
	$\geq +3\text{MHz}$	-	-	-30
	$\leq -3\text{MHz}$	-	-	-30
Modulation Characteristics	$\Delta f_{1\text{avg}}$ (KHz)	-	250	-
	$\Delta f_{2\text{max}}$ (KHz)	-	200	-
	$\Delta f_{2\text{max}}$ Pass Rate (%)	-	100	-
	$\Delta f_{2\text{avg}} / \Delta f_{1\text{avg}}$	-	0.88	-
Carrier Frequency Offset and Drift	Average Fn (KHz)	-	12.5	-
	Drift Rate (KHz/50 μ s)	-	7.4	-
	Avg Drift (KHz/50 μ s)	-	8	-
	Max Drift (KHz/50 μ s)	-	9	-

8.10. Digital IO Pin DC Characteristics

Table 38. IO Pin DC Characteristics

Parameter	Condition	Min	Typical	Max
Input high voltage (V)	VDDIO=3.3V	2	3.3	3.6
Input low voltage (V)	VDDIO=3.3V	-	0	0.9
Output high voltage (V)	VDDIO=3.3V	2.97	-	3.3
Output low voltage (V)	VDDIO=3.3V	0	-	0.33
Input high voltage (V)	VDDIO=2.8V	1.8	2.8	3.1
Input low voltage (V)	VDDIO=2.8V	-	0	0.8
Output high voltage (V)	VDDIO=2.8V	2.5	-	3.1
Output low voltage (V)	VDDIO=2.8V	0	-	0.28
Pull high and pull low resister (KOhm)	-	-	10	-
Driving current (mA) (output high and low current)	P0_2, P0_3, P0_4, P0_5 @VDDIO=3.3V	-	20	-
	other PADS @VDDIO=3.3V	-	8	-
Input high current (μ A)	PAD configure as input mode	-	-	0.1
Input low current (μ A)	PAD configure as input mode	-	-	0.1

8.11. Boot Sequence

The RTL8762A embeds a Power On Reset Circuit (POR), and power on sequence finite state machine to boot the system. A Power on timing diagram is shown as figure below. The RTL8762A also supports reset by an external reset IC through pin 'HW_RST_N'. The HW_RST_N boot sequence is shown in Figure 14, page 106.

Figure 13. Boot Up By Internal Power On Reset Circuit

Figure 14. Boot Up By HW_RST_N Pin

8.12. UART Characteristics

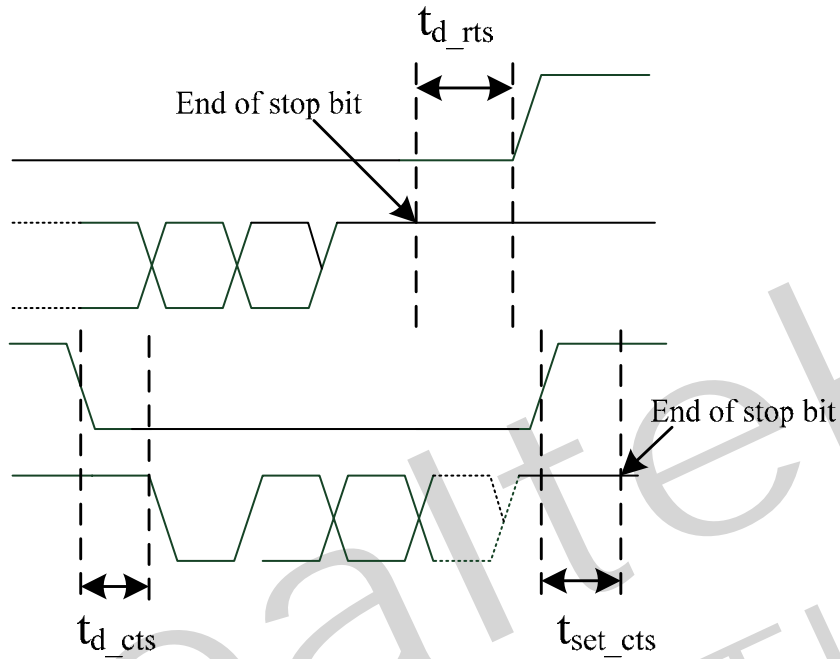

Figure 15. UART Characteristics

Table 39. UART Timing Characteristics

Parameter	Symbol	Min	Typical	Max
Timing between RX Stop bit and RTS go high when RX FIFO is full (symbol time)	t_{d_rts}	-	-	0.5
Timing between CTS go low and device send first bit (ns)	t_{d_cts}	-	-	25
Timing between CTS go high and TX send stop bit (ns)	t_{set_cts}	75	-	-

8.13. I2C Timing Characteristics

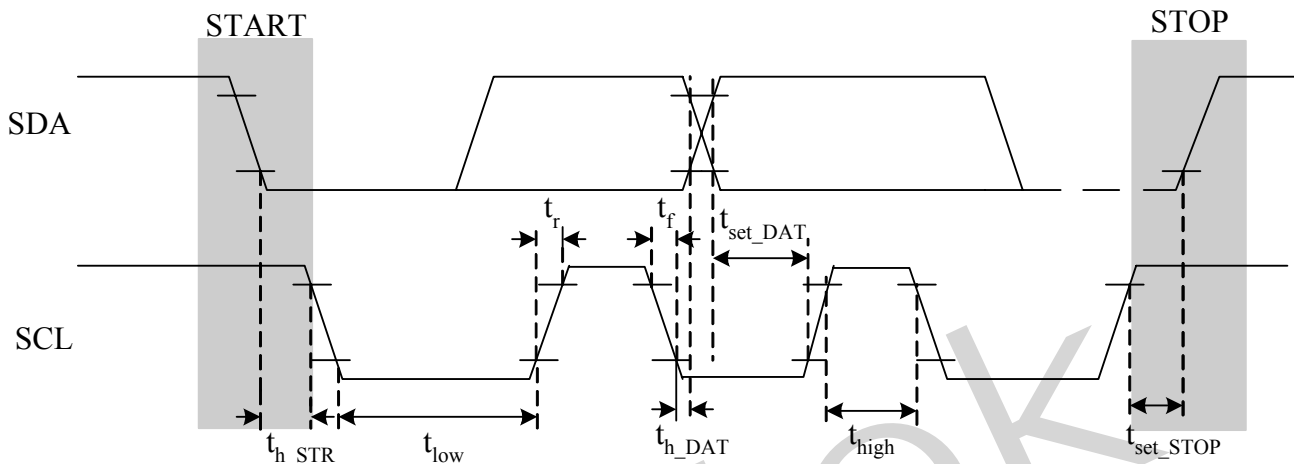

Figure 16. I2C Interface Timing Diagram

Table 40. I2C Timing Characteristics

Parameter	Symbol	Min	Typical	Max
SCL clock frequency (kHz)	-	-	-	400
High period of SCL (ns)	t_{high}	600	-	-
Low period of SCL (ns)	t_{low}	1300	-	-
Hold time of START (ns)	t_{h_STR}	600	-	-
Hold time of DATA (ns)	t_{h_DAT}	0	-	-
Setup time of STOP (ns)	t_{set_STOP}	600	-	-
Setup time of DATA (ns)	t_{set_DAT}	100	-	-
Rise time of SCL and SDA (ns) (with 4.7k ohm resistor pulled high)	t_r	See note	-	-
Fall time of SCA and SDA (ns)	t_f	See note	-	-

Note: Depends on the external bus pull up resistor.

8.14. Power Consumption

8.14.1. Low Power Mode

Table 41. Low Power Mode (Typical)

Power Mode	Always on Registers	32k RCOSC/XTAL	Retention SRAM	CPU	Wakeup Method	Current Consumption (VBAT=3V)
Power down	ON	OFF	OFF	OFF	Wakeup by GPIO	200nA
Deep LPS	ON	ON	Retention	OFF	Wakeup by GPIO, timer	1.1μA

8.14.2. Active Mode

Table 42. Active Mode (Typical)

Power Mode	Current Consumption (VBAT=3V)
Active RX mode	6.9mA
Active TX mode (TX power: 0dBm)	5.2mA

9. Mechanical Dimensions
